Heyhack

Heyhack Recon

Uncover Sensitive Company Information on the Internet

Use Heyhack to search through the Internet, public source repositories, exposed servers, and other sources to discover leaked company information (including credentials, system designs, unprotected applications, and more). Quickly find and limit public information.

62% of Breaches Due to Leaked Creds

The majority of system breaches occur due to leaked credentials. Actively prevent breaches by staying in control of leaked information and proactively remove data that have been exposed accidentally.

Be Alerted when Data Are Leaked

Heyhack Recon will automatically alert you whenever sensitive company data have been found on the public Internet. Heyhack will tell you where the information has been found so you can quickly control it.

Search through Billions of Records

Heyhack Recon searches through a wide variety of publicly available resources, including search engines, source code repositories (Bitbucket, GitHub and GitLab) to uncover leaked company information.

Simple Overview of Found Records

Gain a clear overview of found records of information that makes it easy for you to make appropriate corrective action. Get direct links to findings so you can evaluate the information before taking action.

Integrates with Your SIEM System

Connect Heyhack with your SIEM solution so you can register and manage threats identified by Heyhack Recon. Easily control findings from one central place that you already use in your organization.

Complete Map of Exposed Servers

Heyhack Recon automatically creates an interactive map of all exposed company servers, including information on operating systems, running server software, and apps. Easily lock down exposed servers.
