Enhance SAP with Microsoft

Boost efficiency and unlock agility

In today's dynamic landscape, SAP solutions are the cornerstone of operations for many companies. However, specific needs often call for solutions beyond the standard offerings, which can lead to inefficient workarounds. Hitachi Solutions can help identify areas of potential value and help you to reduce inefficiency and increase productivity across your organisation

As an example, one of our clients previously managed HR services through labour-intensive, error-prone manual processes.

Through the implementation of a Microsoft low-code app, we achieved:

- **250% ROI within the first year**

- Significant **time** and **cost** savings within **five months of launch**

- Recovered **600 annual working days** for critical tasks

- Implemented a **user-friendly, role-based solution with no additional training required**

- **Enhanced data quality** and **reduced errors** through process automation and centralisation

- **Improved transparency** with automated progress updates and access to historical data

- **Heightened security through centralised data management** and role-based access controls

Let's collaborate to identify and envision YOUR innovative solution!

Our approach

Through a series of workshops and interviews, we will identify individual pain points and envision a solution that addresses your specific needs.

From pain...

- Analyse and prioritise your individual pain points
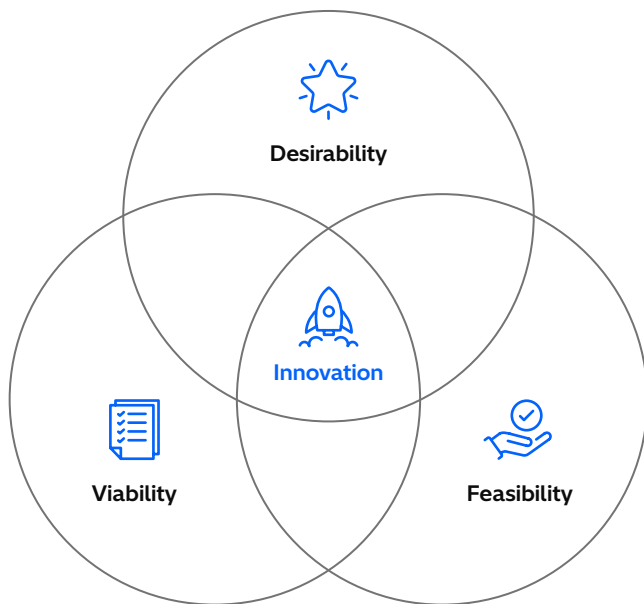

...to gain!

- Together, we pinpoint specific use cases that deliver immediate value, ensuring swift wins for your business

- You'll be provided with a roadmap and a cost breakdown for an implementation scenario of possible solutions

- With this information in hand, you have the freedom to choose whether to implement the solution independently or continue collaborating with our team of experts

Our perspective on innovation

We perceive innovation as a comprehensive transformation, considering three vital aspects: **economics (viability), addressing people's needs (desirability)**, and **leveraging technology (feasibility).**

Economic Impact
(viability)

Together, we analyse your existing challenges and pinpoint precise scenarios where investments lead to quick and substantial returns.

Addressing user needs
(desirability)

We recognise that conventional ERP solutions, such as SAP, might not address every unique requirement. Our goal is to equip the end user with customised Microsoft solutions that precisely meet their individual needs.

Technical feasibility
(feasibility)

Our objective is to equip you with a transparent roadmap outlining a potential implementation scenario, along with a rough cost breakdown to ensure seamless execution.

Our commitment to your success

From identifying use cases to successful implementation and beyond, our experts are dedicated to ensuring you achieve the expected value. We not only assist in implementing solutions but can also guide you through effective change management for seamless adoption. Furthermore, we extend support in crucial areas including maintenance, testing, quality assurance, training, and ongoing development. Our aim is to provide you with comprehensive assistance throughout the entire process, ensuring you extract the maximum benefit from your solution.
