

Energy Efficiency

Reducing energy consumption
for a greener world

minsait

An Indra company

Energy Efficiency

Technology to make energy, gas and water consumption more efficient through metering and advanced analytics.

Digitizing to reduce energy consumption

The uncertainty surrounding today's energy market, rising energy costs and fluctuating commodity prices are energy costs and fluctuating product prices, mean that players in various sectors around the world are looking for ways to reduce their energy bills, improve internal processes and comply with local energy regulations. Under these circumstances, the market is demanding a unified and centralized software solution capable of monitoring a range of client's assets.

The goals of the 2030 Agenda are forcing companies to reduce their emissions by implementing increasingly demanding regulations and higher emission rights acquisition costs. Minsait has therefore taken it upon itself to analyze these market concerns and come up with an effective solution.

Optimizing the energy transition

Focused on both ESCOs and energy-intensive final users, Onesait Efficiency is an end-to-end solution designed for different use cases related to global energy management, sustainable buildings or regulatory compliance, delivering results in the short term.

Minsait provides hardware developed by our partners with certified standards. In addition, offering our own management software, the services of all installers and energy efficiency specialists, we help reduce energy consumption.

Our team of experts accompanies our clients throughout the energy management process:

- From the initial energy analysis of the installation, a detailed study is carried out to identify improvement points and choose the technical equipment that best suits the customer's needs, with a fast time-to-market
- Ending with advice on the process of change towards the new energy paradigm, with the inclusion of renewable energies, electric vehicles or active demand management

Enhancing client assets with Artificial Intelligence

We optimize consumption in cases concerning global energy management in industries, sustainable construction or compliance with regulations. In the current energy efficiency market, we have become a key player in this area by:

- Saving energy through direct control and routine programming
- Reducing CO2 emissions by enabling compliance with environmental regulations
- Detecting inefficiencies through monitoring, alerts and benchmarking
- Reducing human management costs through automated processes

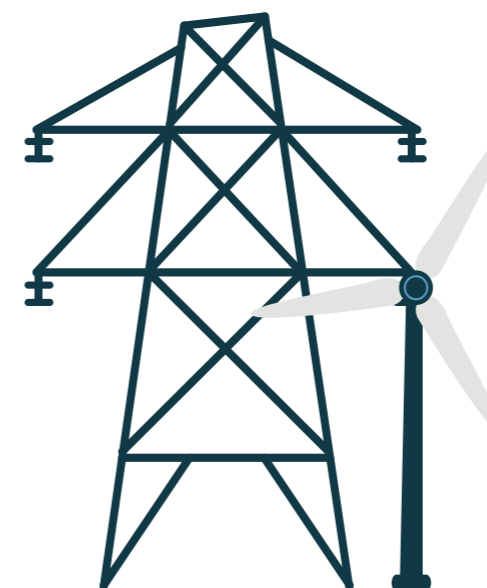

The value we bring to energy management

up to **15%** direct energy savings ⁽¹⁾

up to **42%** reduction in CO2 emissions ⁽²⁾

less than **2** years of ROI ⁽³⁾
