

Data & AI Consulting Service

Realize the Potential of Data use BI and AI on Azure

Today, data is everywhere; petabytes of data are generated every second. Many organizations understand the value of collecting data to become competitive in the market and to bring in innovation and profitability into their products and services. However, gleaning insights from data is challenging, big data is not the challenge but good quality data is. More than collecting data, your company will have to ensure that the data used in problem solving is relevant and properly manipulated to address the business question at hand.

To become a data-driven company, and move from creating reports to generating new business value through data by making new correlations, predictions, or automations. In this Business Intelligence and Data Science are part of the solution but to do this industrialized you need a good foundation, aka the data Platform. And therefore, data governance and quality management is very important. We have translated this into our approach with 3P's: Data Platform (the technology) and People & Process (the more organizational aspects to get this embed in the organization).

Would you like to uncover the opportunities that data brings with BI a AI to your company, or would you like to challenge your initial ideas with experts? Are you aware of how using Azure Data Platform services allow you to add intelligence to your applications and workflows?

We can accompany you through from ideation workshops, the development of a tailored Advanced Analytics use case of POC to build Industry-level analytics.

Data & AI Consulting Service

Closing the skills gap

Data governance

Customer data hub

Data & AI Consulting Service:

We believe in the power of data to enable digitalization and business growth. While technologies such as Business Intelligence or AI and Data Science are highly useful tools for value creation, they are a means, not an end. We always search for the most suitable solution for your situation, data products that will create business value. In this way, we can help you move from traditional reports and dashboards to self-service BI and intelligent applications that make use of technologies such as AI and machine learning. Data governance, which focuses on the organizational and behavioral aspects, is an integral part of our methodology.
