

Product Information AgedCareAI

MODULE & FEATURE BREAKDOWN

Initial Setup (One-off)	The initial setup covers the end-to-end deployment of the AgedCareAI platform, including configuration of the server environment, databases and AI models within the organisation's-controlled infrastructure. It also includes user access setup, document indexing and preparation of the organisation's knowledge base. This establishes a secure, scalable foundation that enables immediate access to core AI capabilities from the first month, while supporting future expansion into integrated and data-driven use cases.
Clinical Integration (One-off)	Clinical integration enables the platform to connect with supported clinical systems, providing access to resident data such as profiles, progress notes, assessments and related records. This establishes a foundation for AI-driven capabilities using organisational data, supporting more informed and efficient operational use.
Monthly Subscription	The monthly subscription provides ongoing access to the platform, including all selected modules, system availability, updates and standard support. It enables continuous use and progressive expansion of AI capabilities across the organisation.
Analytics	Analytics provides a centralised view of key operational, clinical and organisational information through close-to-live metrics, trends and AI-driven summaries. It helps teams quickly monitor performance, identify risks and gain visibility across multiple areas of the organisation in one place.
AskMe	AskMe offers pre-configured prompts tailored to common operational, clinical and compliance-related queries. It guides staff in using AI effectively for routine questions and tasks.
Assist (Beta Version)	Assist is a browser-based tool that supports staff while working within existing systems. It provides real-time suggestions, helps complete content and improves efficiency during daily tasks.

Chat	Chat provides a conversational AI interface with session history and analysis capabilities, allowing users to ask questions and receive accurate, context-aware responses based on trained knowledge and available data. It simplifies access to information and supports faster understanding without the need for manual searching.
Canvas	Canvas is a structured workspace designed for creating, editing and refining content such as care notes, reports, summaries, internal documentation and more. It supports consistent and efficient content generation.
Insights	Insights provides AI-driven analysis across clinical, operational and organisational data to identify trends, risks and key patterns. It helps teams generate faster, more informed decisions by transforming complex information into clear, actionable insights across areas such as clinical care, incidents, workforce and operational performance.
Forms (Beta Version)	Forms help staff complete forms within existing web-based systems by using AI to assist with content generation, recommendations and data entry support. It reduces manual effort, improves consistency and helps streamline everyday operational and clinical workflows.
Mobile Access	Mobile access enables staff to interact with AgedCareAI through mobile devices, supporting usage on the floor and improving access to information without being tied to a workstation.
Operational Workflows	Operational Workflows are automated tasks that run in the background and deliver outputs such as notifications, reports or actions to users via channels like email or system dashboards. They help streamline routine processes, reduce manual effort and ensure consistent execution of operational tasks.
Other System Integrations	The platform can integrate with additional systems such as rostering, HR, finance and maintenance platforms, enabling broader organisational connectivity. A one-off implementation cost applies per integration and will be provided as a separate quote based on scope and technical requirements.

**Cross-System
Intelligence**

Cross-system intelligence allows the AI to interpret and combine data from multiple systems, providing a more complete operational picture and supporting better-informed decisions.

Users

All packages include unlimited users, enabling organisation-wide adoption without additional licensing costs per user.
