

Growing at an industrial scale with Growth Towers

Automation in the Growth Tower reduces labour requirements and minimises human intervention to improve biosecurity.

Modularity means that large sites are simply a sum of multiple Growth Towers. These cultivation modules enhance biosecurity and minimise human disruption to create a consistent environment for predictive growth.

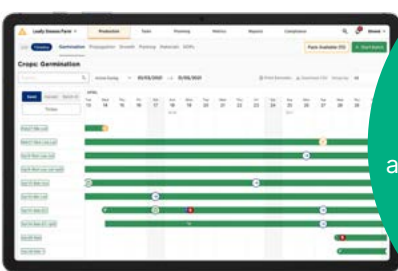

Maximise site footprint by building 6 m, 9 m or 12 m Growth Towers

The GTMS (Growth Tower Management System) is a secure, Cloud-based platform responsible for operating and monitoring the Growth Towers.

Propagators can grow starter plants close to traditional cultivation systems such as glasshouses. This reduces disease risks, food waste and improves surety of local supply.

Our system is scalable and built with the customer's business growth in mind.

The Cultivation Management Platform enables your staff (planners, growers, operators) to coordinate and oversee all aspects of the cultivation process outside of the growth cycle inside the Towers, right from seed to shipping if required.
