Motion Dependent ⚠

Defect in Ballscrew Nut ⚠

Defect in Carriages

Motor Fault

Drive-Side Bearing Fault

Free-Side Bearing Fault

Change in Lubrication Condition

Defect in Coupling

Position Dependent

Assembly Related

Explanation

Effects

Backlash, decreased accuracy, lower load capacity, potential quality defects, contamination.

Root Causes

Excessive load, axial misalignment, inadequate lubrication, surface and sub-surface cracks.

Actions / Recommendations

Enhance lubrication, improve sealing, avoid impact loads, review ballscrew size, improve assembly accuracy. If indicated by IPercept, consider replacing the component(s).

Imagine if you could...

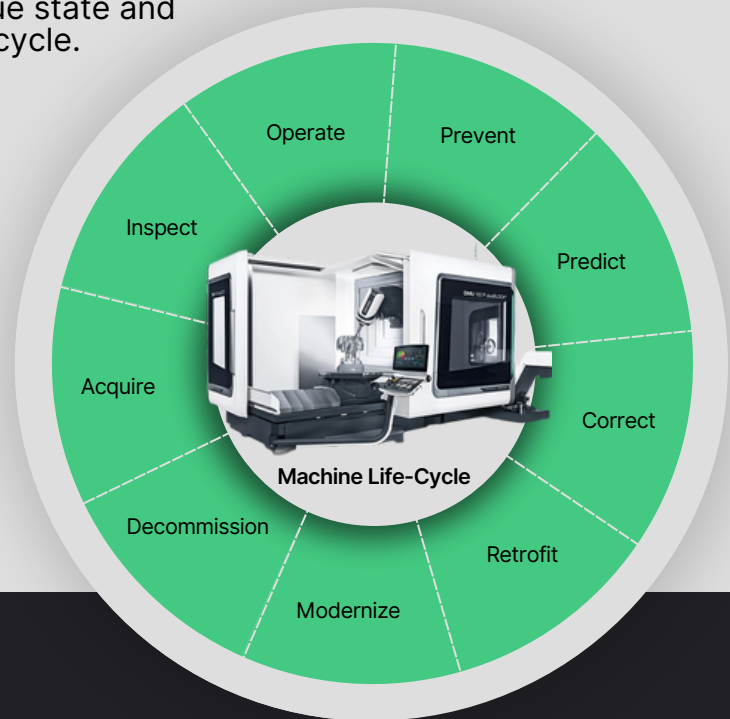

- Know the mechanical health of a complex machine without needing an on-site visit
- Be alerted well in advance that something is about to fail
- Know on component level what needs to be checked before starting a repair
- Improve maintenance so the lifetime of the machine can be extended
- Understand how a machine is being utilized

At IPercept, we are making this a reality.

Our service provides actionable insights into the true state and usage of your machines at every stage of their life cycle.

We enable

- Predictive and Prescriptive Maintenance
- Increased Machine Utilization and Efficiency
- Optimized Planned Downtime
- Minimized Unplanned Stops
- Reduced Quality Losses
- A More Sustainable Production

Insights in 4 simple steps

One

Install the IPercept Smart IIoT Device on any metalworking machine, old or new, with just a 24V supply.

Two

Run weekly tests that take about 5 minutes by executing a G-code.

Three

IPercept's algorithms automatically analyze the data and turn it into alerts and recommendations.

Four

Plan and prioritize production and maintenance by understanding the machine's true state.
