

Microsoft Endpoint Security Assessment

iver

With Iver, you get a combination of dedicated experts, managed services and a customer-centric culture

Dedicated experts

Dedicated consulting with +300 experts to accelerate your digital transformation...

+

Managed services

... is supported by a modern and secure multi-cloud technology platform with EU-compliant delivery options...

+

The Iver way

... and a clear promise to all our customers. We promise to always exist: Beside you, Behind you and Before you.

Microsoft Endpoint Security Assessment

Challenges

Solution

Benefits

Challenges

Limited visibility into endpoint security posture?

Many organizations lack a clear overview of how secure their endpoints actually are across different platforms and operating systems.

Increased risk and compliance pressure?

Weak configurations, unmanaged vulnerabilities, and unclear responsibilities increase exposure to security incidents and regulatory non-compliance.

Inconsistent configurations and policy gaps?

Security settings, Intune policies, and access controls are often misaligned, outdated, or not implemented according to best practices.

The solution

Comprehensive review of your endpoint environment

We assess security configurations across Windows, macOS, iOS, and Android, including Intune policies, OS security settings, identity controls, and application security.

Clear, prioritized recommendations

The assessment results in a structured report highlighting risks, deviations, and concrete actions to improve your security posture.

Benchmark against best practices and CIS guidelines

Your current setup is compared to Microsoft-recommended configurations and Iver's CIS-based security framework.

Benefits

Improved security and reduced risk

Identify vulnerabilities and misconfigurations before they lead to incidents.

Better control and compliance readiness

Gain confidence that your endpoint security aligns with industry best practices and regulatory expectations.

Clear roadmap for strengthening endpoint security

Get a prioritized and actionable plan tailored to your environment and business needs.

Microsoft Endpoint Security Assessment Package

-In three steps

Preparation

1-2 hours workshop for:

- Questionnaire review
- Set scope (Windows, iOS, macOS & Android)
- Set timeline

Assess

Iver performs an inventory of the current device management environment to identify:

- Security configurations and policies
- Application security
- Identity & Access controls
- Vulnerabilities and risk indicators

Report

The inventory data is analyzed and compiled into an assessment report that is presented in a 1-2 hours workshop to discuss:

- Findings per area
- Conclusion and Risks
- Recommendations
- Transformation Methodology

Thank you!
