Background - Yammer migration

Microsoft does not have a recommended approach for migrating Yammer between tenants.

Since there is no direct way to migrate the data, lot of cases it's re-adding users to the proper place in Yammer in target tenant.

If you have legal requirements, you must do eDiscovery on the source, and retain that information.

You could set up the community networks again, re-add members, and do those kinds of aspects.

How to migrate?

Apps4Pro Migration manager provides the programmatical way of migrating the below items in Yammer between tenants

- Internal Network
- External Network
- Conversations
- SharePoint Online files
- Yammer Files
- Meta data (Created Date, Created By, Like, Tag, Topic, Best Reply)

Error free migration – all success and failed actions are logged

Re-try – App can retry the failed actions occurred during migration

Incremental migration supported:

- New thread posts and old thread replies with attachments.
- Files Incremental Migration supported for new files and edited files.
- Topics Incremental Migration supported for new topics added in message.
- Likes and Best Reply Incremental Migration supported for only new likes&best reply.

Non-Native Mode to Native Mode Migration

When you migrate Non-Native Mode group to Native Mode for M365 group, the files from the source Yammer group is migrated to the SharePoint Online Site document library created by default for Yammer.

The conversations from the source is posted to the target Yammer Native group
