# jile

Adopt Agile. Scale. Transform.

Business agility is an evolutionary transformation. Jile is an enterprise Agile DevOps product that helps organizations adopt Agile, scale and transform faster. It aligns high-level business objectives with software execution and enables cross-functional BizDevOps teams to collaborate and drive more valuable results.

Visualize the Value Stream

Jile combines an enterprise Agile planning tool with DevOps pipeline automation capabilities that provides visibility into the entire software delivery value stream from—ideation to delivery—to measure and improve performance.

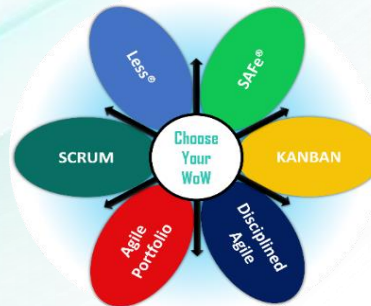

Scale Agile Across the Enterprise

Jile is specifically built to scale Agile across an organization from Teams to Products to Portfolios.

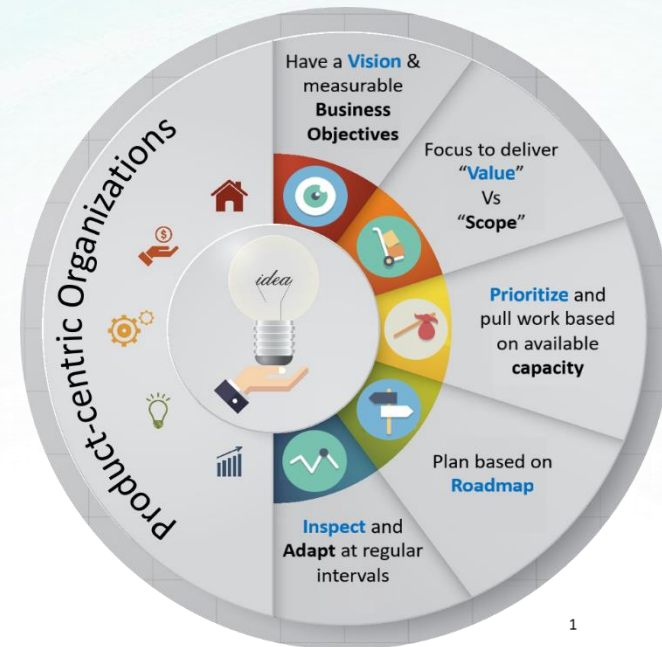

Choose your Way of Working

Jile enables an evolutionary Agile transformation through its support for multiple Agile Ways of Working (WoW).

Software delivery teams have the flexibility to select the Agile practice that best fits their team's needs depending on where they are in the Agile transformation journey. As the organization grows and changes, the team can select a different Agile method or framework to optimize their performance.

Transition to Product-centric Delivery

Jile was specifically developed to help organizations transition from project- to product-centric delivery in order to transform into a truly agile enterprise. Product-centric delivery is a way of organizing IT teams to continuously deliver software value with more emphasis on 'Outcome' rather than the 'Output'.

A Product-centric delivery approach aligns business strategy to software development and execution, while empowering Agile teams to decide what is best for their product. Jile can also benefit organizations that practice project-centric delivery.

The Jile Advantage

An Enterprise Agile DevOps Product for your Way of Working

Framework Agnostic
Select from popular Agile methodologies and frameworks such as Scrum, Kanban, Disciplined Agile, LeSS and more.

Built for Enterprise Agile
Scale Agile across the enterprise from Teams to Products to Portfolio.

CI/CD Pipeline Automation
Connect DevOps tools and define stages in the CI/CD pipeline to automate and orchestrate delivery.

Agile Test Management
Design, plan and execute Test cases and track the test progress at release and iteration levels.
