

Privileged Identity Management Accelerator

Minimize standing Azure AD and M365 administrative access to secure information with just-in-time access.

Sprawling threats put your organization at risk. Take a simple step to remove standing access for administrators, reducing the attack surface to your M365 services.

Privileged Identity Management is essential for staff who need elevated access. Implementation of PIM allows for:

- ▶ Provide just-in-time privileged access to Azure AD and Azure resources.
- ▶ Assign time-bound access to resources using start and end dates.
- ▶ Require approval to activate privileged roles.
- ▶ Enforce multi-factor authentication to activate any role.
- ▶ Use justification to understand why users activate.
- ▶ Get notifications when privileged roles are activated.
- ▶ Conduct access reviews to ensure users still need roles.
- ▶ Download audit history for internal or external audit.

In addition to PIM, admin account security measures and break glass account recommendations will provide opportunity for further securing the environment.

Privileged Identity Management Deliverables:

- ▶ Completed Privileged Identity Management overview and planning session.
- ▶ Recommendations provided for M365 administrative accounts and break glass accounts.
- ▶ Licenses assigned to targeted admin accounts.
- ▶ PIM configured and admins assigned for Global Admin and a second highly privileged role.
- ▶ Validated Privileged Identity Management workflows.
- ▶ Documented role settings and assigned users.

KiZAN will assist your organization with initializing Privileged Identity Management for Global Admin and a second highly privileged Azure AD role. This implementation will provide education on the PIM solution, giving your organization the tools necessary for a broader deployment.
