Monitor Types

Application Insights

- Get metrics about your Azure application from Application Insights. These metrics include requests count, users count, page views count, exceptions count, sessions count and many more.
- Get events related to your Azure application from Application Insights. These events include exceptions, traces, page views and requests.

Azure Active Directory

- Get notified about your Azure AD App Registrations which have secrets that are close to expiration time. You can prevent product failures by renewing your secrets before they expire and cause downtime.

Azure DevOps

- Get notified about your Azure DevOps pipelines when they fail or complete successfully.

Cost Management

- Azure subscriptions may contain resources which may burn your budget. Get notified when the cost of your subscription exceeds a threshold that you define.

Security Center

- Get periodic reports about your subscription's Secure Score. In addition, you will be notified about any Security Alerts and Recommendations.

Ping

- You can define a ping monitor which will periodically ping a host that you specify and notify you when ping fails.

NSLookup

- You can define an NSLookup monitor which will periodically execute nslookup for a target host name. You will be notified when nslookup fails to resolve the host name.
