

The Future of Software Supply Chain Security

Protect Your Digital Business and Accelerate DevSecOps

When software development shifted to DevOps, the pace of new releases grew rapidly. Unfortunately, this also created a sprawling and frequently changing attack surface in need of protection: your software supply chain including build pipelines and systems. Legit helps security teams modernize their AppSec programs to successfully defend against these new threats with a SaaS solution that provides automated visibility into your SDLC, helps you prevent attacks, and provides continuous assurance that applications are released without vulnerabilities.

"We're now able to inventory all our SDLC systems and security tools, view developer activity, and detect and remediate vulnerabilities across them fast."

Head of DevSecOps | Takeda Pharmaceutical Company

A New Approach is Required to Mitigate Risk Across the SDLC

- Gartner predicts a 3x increase in software supply chain attacks
- Your vulnerabilities are growing faster than your AppSec coverage, creating too much exposure to risk
- You need a platform that accelerates DevSecOps at scale

The Legit Security Platform

Legit Security offers a modern, easy-to-implement, enterprise SaaS platform that protects your software supply chain from attacks by securing your cloud or on-prem CI/CD pipelines. Unlike traditional AppSec tools and scanners that focus narrowly on scanning your app's source code, Legit scans your development pipelines and systems. This enables Legit to provide you with the broadest and deepest SDLC security visibility available.

Automated SDLC Discovery

You can't protect what you can't see. View the most complete, always-up-to-date and centralized inventory of your SDLC, including the assets and security controls you are using with in-depth context.

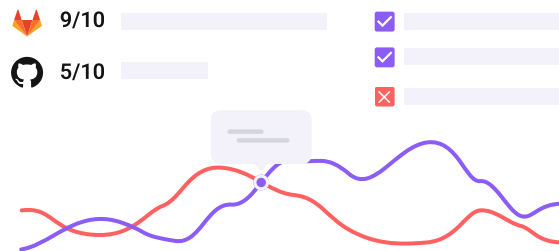

Risk Protection and Remediation

Reduce risks across your SDLC early and prevent them from spreading downstream. Instantly surface and quickly remediate vulnerabilities in your build pipelines like insecure build actions, SDLC and IaC misconfigs, sensitive data leakages and more with 100s of policies.

Security Scoring and Compliance

Always know your security posture. Monitor drift from compliance frameworks and be alerted when a security guardrail is removed. Track trends, compare teams and see your security posture at-a-glance with Legit's security score.

Enterprise-Grade Platform That's Easy to Implement

Legit doesn't interfere with existing development tools or workflows, and works with cloud and on-prem resources. Connect in minutes, agentlessly. Then, instantly start seeing security issues in your software supply chain environment.
