

Malicis WVD Consulting Design & Deployment

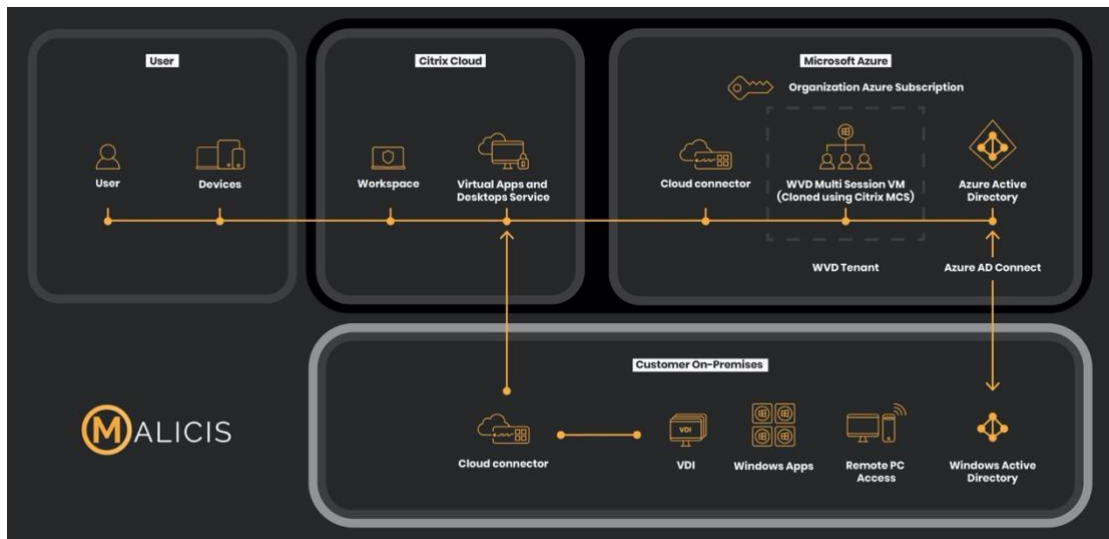

The single most used app every day on computing and mobile devices is the desktop.
Virtualized desktops have now become critical infrastructure for productivity. Expert help matters!

74 % According to Malicis Consulting's VDI audits, 7 out of 10 do-it-yourself virtual desktop solutions are misconfigured or inadequately scoped.

It's tempting to do-it-yourself when all the tools are available in the public cloud. Microsoft Windows Virtual Desktops (WVD) allows customers to deploy on-demand infrastructure to deliver virtualized desktops and apps to their users. But can your IT team correctly architect the solution, and scope and configure the required resources? Does your IT team have the right combination of skills and experience?

Why Microsoft Windows Virtual Desktop?

1. **Cost control:** With a cloud-based solution, your IT team can reduce the amount of CAPEX required to support your virtual desktop solution and you pay as you grow. Cost savings can be passed on to the business to improve the bottom line or invested in value-added projects.
2. **Proven reference architecture:** Malicis uses Microsoft WVD reference architecture as a basis for each design and then adjusts it according to each customer's needs; no two virtual desktop solutions are the same; some customer applications require advanced server architectures that may include GPUs for 3D modeling, for example.

3. This means that your employees can work anywhere if they have Internet connectivity and a computing device (PC, laptop, tablet) and doesn't limit

Don't go it alone: let Malicis expert Consultants help

Malicis Consultants use a methodical approach to help businesses take advantage of cloud-based virtual desktops. Prior to undertaking any work, Malicis Consultants discuss the project objectives with the customer to understand the scale and scope of the project and prepare an estimated duration of the project.

Our process incorporates an **assessment** of your business needs - including a review of the applications used, the supporting IT infrastructure and hardware scoping, dependencies and any deployment preferences including WVD alone or with Citrix cloud or VMware Horizon View - that usually lasts between 1 and 3 days depending on the complexity. This information is used to **design** the WVD architecture that will deliver the virtualized desktop and apps to your users (approximately 1-2 weeks). Finally, Malicis **deploys** the turn-key solution into your Microsoft Azure tenant over the course of the following 1-2 weeks.

Find your peace of mind

Malicis is the leader in full-stack end-user computing and has world-class virtual desktop expertise based on Microsoft, Citrix and VMware technologies. Our mission is to help organizations deploy and manage their virtual desktop infrastructure on premises or in the cloud. Work with an experienced, certified partner that offers a full range of services, not single offer service providers that can't follow through or can't support you when you need it.

See our Malicis WVD Expert Consulting - Design & Deployment offer on the Microsoft Azure Marketplace or contact the experts at Malicis for a free assessment at info@malicis.com.
