prodware

RSAT Implementation
Service

A service that automates
Dynamics 365 Finance and Supply Chain
Management tests – saving time and
ensuring reliability

If you are responsible for ensuring your organization benefits from the latest technology you will recognize these challenges:

"As a CIO, our company benefits greatly from the cloud-based applications we use and of course this means regular updates. My team need to be more proactive and efficient with testing the impact on our users and their processes before they are released into our live system."

"As a department manager, I find it frustrating that our team have to report bugs in the system after its updated. While I can see the benefits of having an up-to-date business applications, it interrupts our daily work. IT are aware of our processes so this should not happen."

"Our IT team find themselves constantly testing and retesting, which is taking a lot of time. We would welcome automation in the process to free up their time."

Why choose Prodware to support your Microsoft system's release management?	The RSAT Implementation service is split into four phases: Preparation, Analysis, Conclusion, Training – and includes:
The Regression suite automation tool (RSAT) from Microsoft reduces the time and cost of user acceptance testing (UAT) of apps. UAT is typically required before you take a Microsoft Dynamics 365 Finance and Supply Chain Management application update, or before you apply custom code and configurations to your production environment. RSAT is fully integrated with Microsoft Azure DevOps for test execution, reporting, and investigation. As a Microsoft partner, Prodware has developed, implemented and maintained Microsoft Dynamics 365 Finance and Supply Chain Management projects across Europe, as such our team use the RSAT tool everyday and now bring our experience in a framework service.	⟩ Installation of the RSAT tool on your specified Virtual Machine ⟩ Configuration on LCS and Azure DevOps environments ⟩ Using Task Recorder, we record your critical business processes from documents you provide ⟩ Run regression tests for all recorded processes ⟩ Review any failed test results, adjust the recording if needed, document successful and failed tests in detail and provide next best actions ⟩ Train your team on RSAT, LCS and DevOps to run future tests and update the business processes ⟩ In addition to RSAT implementation, your business can opt for Prodware to maintain the running of the tool, particularly useful as your business processes evolve

Contact Prodware to help your business run smoothly, using the latest in IT best practice to minimize interruption and improve release management processes.
