

Mercury is a solution for the recruitment and staffing industry, we are a born in the cloud Dynamics 365/ Power Apps solution with a significant amount of IP as part of our managed solution. The full solution includes a comprehensive entity model, myriad configuration points and a heavy reliance on manual "back end" configuration within our multi-tenancy Azure-based estate. The solution itself also has well over 100 custom tables and many more processes, plugins and cloud flows.

Using Mercury is therefore much more involved than simply installing a simple solution file. Our customers must engage with Mercury's implementation team to plan and execute a successful implementation, including ensuring that all pre-requisite reference data, configuration points and third-party credentials are in place. Even with a solution file, it is not possible to install and use Mercury independently.

As a line-of-business application, Mercury's Use Cases run into the hundreds and therefore documenting them and providing sufficient guidance for them to be tested via the Marketplace submission would be an extremely complex endeavour.

Since our Marketplace presence will always be a "Contact Us" listing, this solution has been provided as an introduction to the Mercury product only. Consequently, it is non-functional and simply includes pointers to our marketing materials.

Please contact us if more information is required.
