

Get a better overview and control of your cloud services.

Cloud Cop is your auditor in the cloud and will help you to achieve control of your cloud environment, for better overview, the right level of security, reduced costs, and increased efficiency.

When using cloud services, it's important to consider what is most important for your company in terms of protecting its values and achieving increased results.

Our solution simplifies policy administration and streamlines governance processes with our best practice-based approach tailored to business needs.

Our graphical interface makes it easy to implement, administer and access custom policies, while our value-added abstraction layer categorizes and clarifies frameworks. This gives you faster and easier access to reports, an auditor function, and multi-tenancy.

To achieve desired results with cloud services, it's crucial to establish rules that ensure the use of cloud services aligns with what's important for your business.

We help you quickly establish compliance, achieve simple, structured and efficient management, and facilitate better value creation for your company.

Examples of important factors for securing operations include:

- Control of data and service location
- Control of data traffic
- Data classification
- Better overview of components
- Proactive cost control
- Protecting certificates
- Compliance with standards such as ISO27001

This is why you should choose Cloud Cop

Preparing for the future.

Most businesses that use cloud services do so gradually. As a result, it's easy to forget about the consequences of future scaling when complexity gradually builds up, which can be difficult to manage.

To start off on the right foot, think ahead and establish the most important policies, rules and metrics to be prepared to handle the complexity that will gradually arise in your cloud environment and to protect your values.

We use "best practices."

Our goal is to provide you with the right recommendations based on best practices from various industries in a simplified and more efficient way, so that you can establish the right policies, rules and metrics tailored to your business.

Increased Value Creation

Despite the fact that cloud services already have reporting tools that provide technical information about the environment, it is still necessary to optimize usage in order to get relevant information for the business.

This can be done by establishing rules within the platform to efficiently control usage, resulting in a better reporting foundation for cost control, security, development, and operations.

What is Cloud Cop?

Cloud Cop is a system that helps businesses ensure compliance with security frameworks, such as ISO27001 and NIST. It includes management tools and consulting services for establishing and enforcing policies and rules.

In this way, the business can gain better insight and control to ensure things are done correctly, whether by your own IT department or by vendors.
