- Smart Cities Solutions • Digital Twins, Smart Cities • Control Rooms • CO2 Emissions, Internet of Things (IoT) • Information Sharing
  - Data Collection, Ingestion • Storage
  - Integration • Data Visualization
  - Virtualization • Transformation • Data Security • Analytics • Forecasting • Predictions

The screenshot displays the 'idt cities Dashboards' interface. On the left is a sidebar menu with the following items:

- Dashboards (Public)
- Extra Dashboard Widgets
- Data Management, HLT
- Knowledge and Maps
- Processing Logics / IoT A...
- Entity Directory and Devi...
- Resource Manager
- Development Tools
- Management

The main area shows a grid of dashboard tiles. Three prominent tiles are titled '15 minuti index Bologna Città Metropolitana' and '15MinCityIndex Dashboard', all labeled as 'Proc.Logic / IoT App' and 'Public (DISIT)'. Below these, there are more dashboard tiles, including one titled 'SHM2 Data Map: Digital Facilitator - Firenze'.

In the foreground, a map view is visible with a data popup window. The popup contains the following information:

address	Last value	Last
["addressCountry": "FI", "streetAddress": "Kousalle 17", "addressLocality": "Violsini"]	4.8	
["addressCountry": "FI", "streetAddress": "Kousalle 17", "addressLocality": "Violsini"]	4.8

## WHY SMART CITIES?

A smart city is a digital urban area that leverages technology and data-driven solutions to enhance the efficiency of city operations, improve residents' quality of life, and promote sustainable development.

### Objectives:

- Enhanced urban living
- Infrastructure efficiency
- Sustainability
- Innovation and economic growth
- Data-driven decision-making
- Smart mobility
- Public safety and security
- Community engagement

- 
- **Improved quality of life:** Enhancing transportation efficiency, public safety, and sustainability by optimizing energy usage, waste management, and citizen involvement in decision-making. It also improves public service efficiency, supports cultural and recreational spaces, and enhances public services through data-driven management.
  - **Sustainability:** Monitoring air quality and environmental parameters, it helps address pollution concerns and creates healthier living conditions.
  - **Economic growth:** Fostering innovation and economic growth by attracting businesses and entrepreneurs to the city, creating job opportunities, and driving economic development.

# OUR SMART CITY PLATFORM

idt cities

13 CLIMATE ACTION

11 SUSTAINABLE CITIES AND COMMUNITIES

---

## PERFORMANCE HIGHLIGHTS FROM DEMONSTRATION AND TEST RUNS

- **Overall Satisfaction:** 91% expressed satisfaction, with 53.40% being highly pleased.
- **IoT Solution and Data Analysis:** 85% rated it as very good, and among them, 42.17% ranked it as excellent.
- **Ease of Dashboard Production Tools:** 72.63% found them more than somewhat satisfying.
- **Functions for Creating IOT Apps (MicroServices):** 93% found them complete and satisfactory, with 31.25% considering them very comprehensive.
- **Solution Utility:** 100% acknowledged its usefulness for their work, with 78.13% declaring it would be very useful in their daily tasks."

---

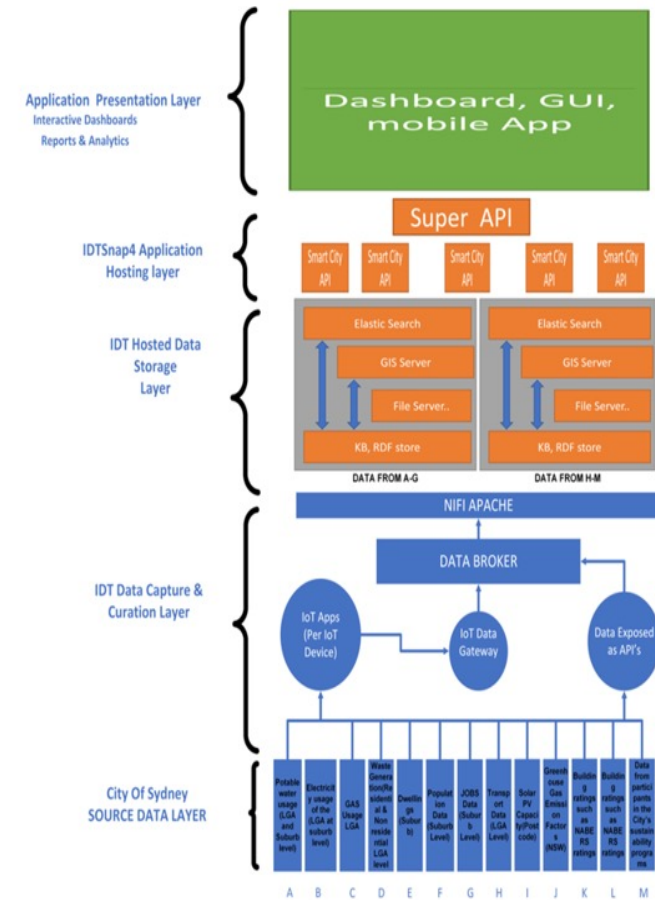

## AS PAAS/SAAS

- IDTcities as a SaaS solution offers a subscription-based model, enabling users to pay for services without upfront infrastructure investment.
- It boasts user-friendly features, scalability, and provides automatic updates and maintenance.
- As a PaaS platform, it empowers users to develop and deploy smart city applications, integrate seamlessly with other systems, and customize functionalities.
- Functioning as a data management hub, IDTcities supports collaboration, innovation, and IoT devices, contributing to a more connected and intelligent urban environment.

# COMPONENTS

- IOT Broker
- IOT App
- IOT Directory
- API Manager
- Federation Smart API
- Data Analytics
- Storage
- Dashboard Manager

# IDTCITIES: FEATURES AND VALUE PROPOSITION

**solutions**

---

## **IDTCITIES OFFERINGS**

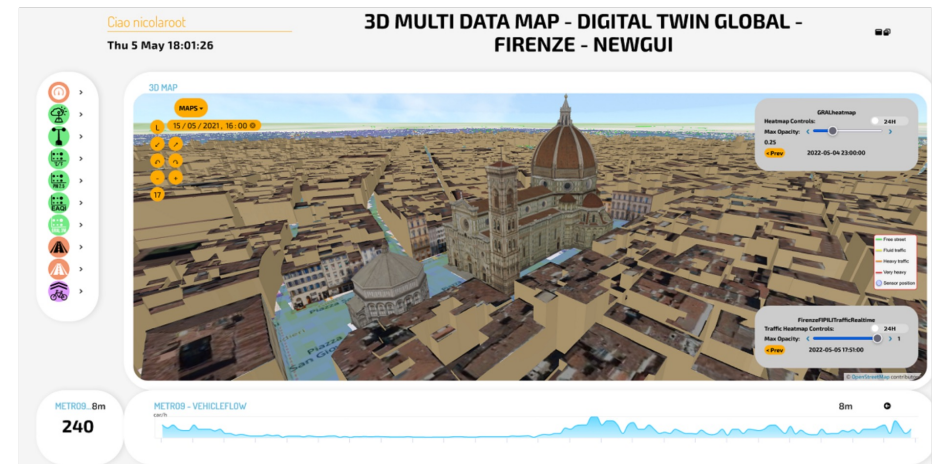

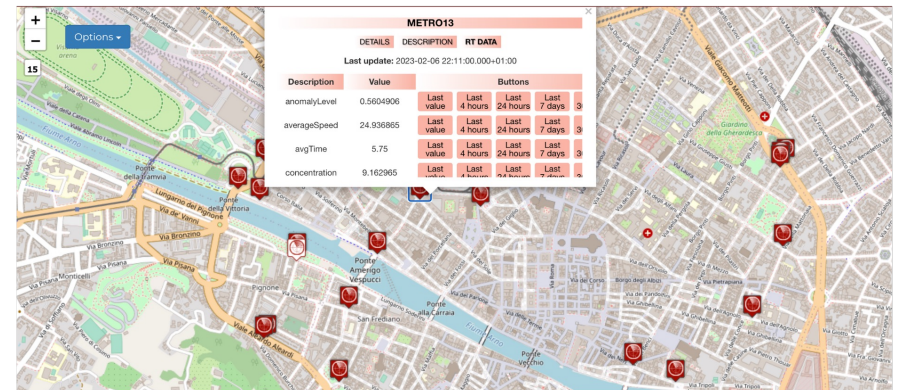

- Integrating and aggregating data from various sources.
- The system provides analytical tools and visualization dashboards for in-depth analysis of collected data.
- Comprehensive traffic management capabilities.
- Inclusive of a variety of smart city services: smart transportation, energy management, waste management, and public safety.
- Promotion of efficiency and sustainability.
- Integrated data management and real-time monitoring.

- 
- Supports the integration of Internet of Things (IoT) devices
  - Customizable to fit the specific needs of a city and scalable to accommodate growth.
  - Includes a decision support system to assist city authorities in making informed decisions based on data analysis.
  - Provides APIs for seamless integration with other systems and services
  - Increased volume of data & transparency of information
  - Ubiquitous access
  - Carbon emission and air quality analysis
  - Security and privacy measures for data collected
-

# DIGITAL TWIN

- Connected with real systems
- Modelling aspects
  - Structural, visual, informative, real time data sensors (context), POI, functional, resources, etc.
- Integration
  - AI/XAI techniques, simulations, users' needs, etc.
- Experiment via simulations and analyse by case
  - Reduction of costs to experiments new solutions
  - Share the possibilities with city users
- Virtual Representation: Easier to understand the context, review from multiple points of view

# LOCAL DIGITAL TWIN

- Detailed aspects modeled digitally for a physical element, such as a chemical plant with machines, motors, silos, etc.
- Each element includes a 3D representation, detailed components, and real-time values of attached sensors, allowing understanding of its behavior in terms of real-time data

# GLOBAL DIGITAL TWIN

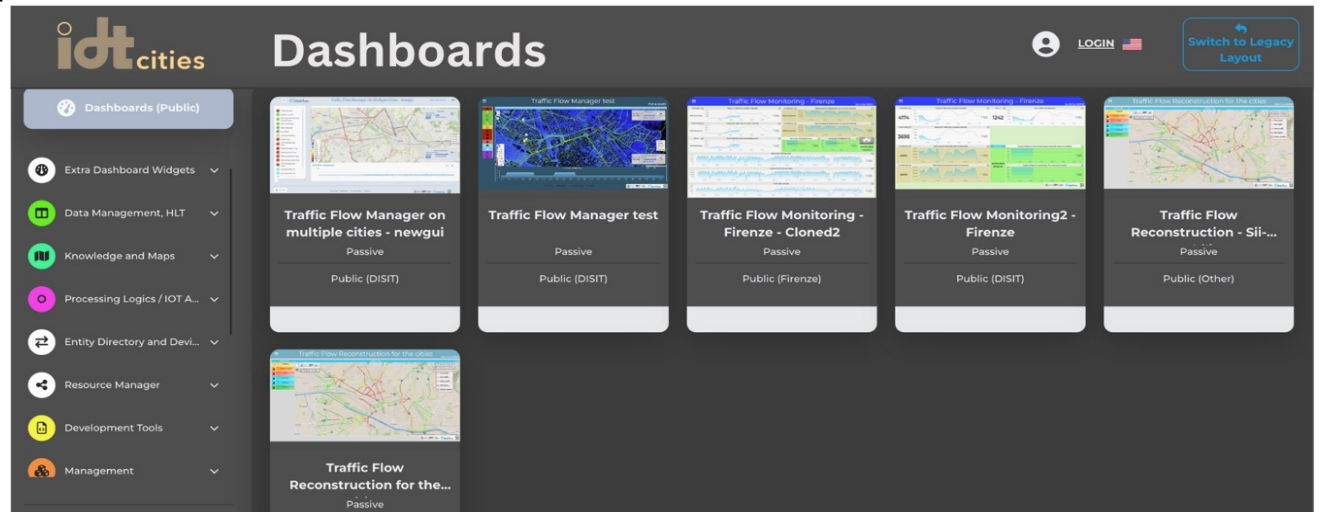

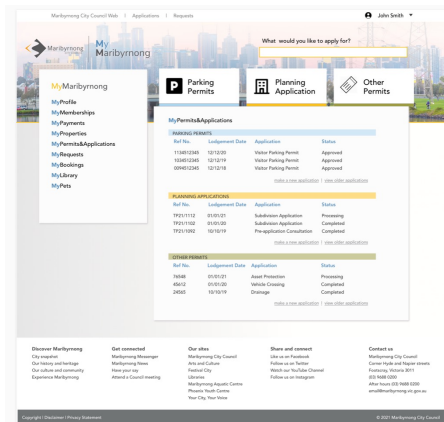

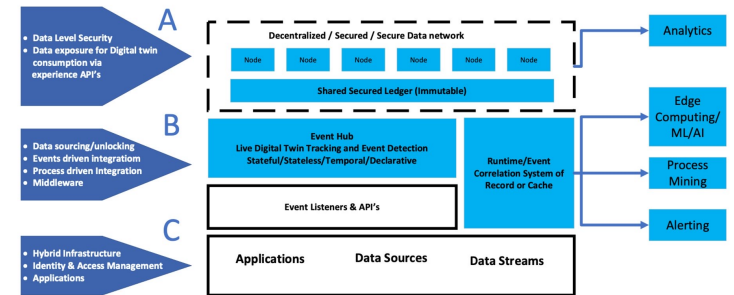

- Detailed aspects digitally modeled for a physical element, such as a chemical plant with machines, motors, silos, etc.
- Each element features a 3D representation, detailed components, and real-time values of attached sensors that can be used to understand its behavior in terms of real-time data.

# PARALLEL DEPLOYMENT

- Digital-twin running in parallel deployment mode requires live data processing. Applications/Systems within different orgs are classified into two main categories
  - Business Support Systems (BSS) – Single Customer View Portal
  - Operations Support Systems(OSS)

# CO<sub>2</sub> ESTIMATION & ANALYTICAL MODEL

# CO2 ESTIMATION

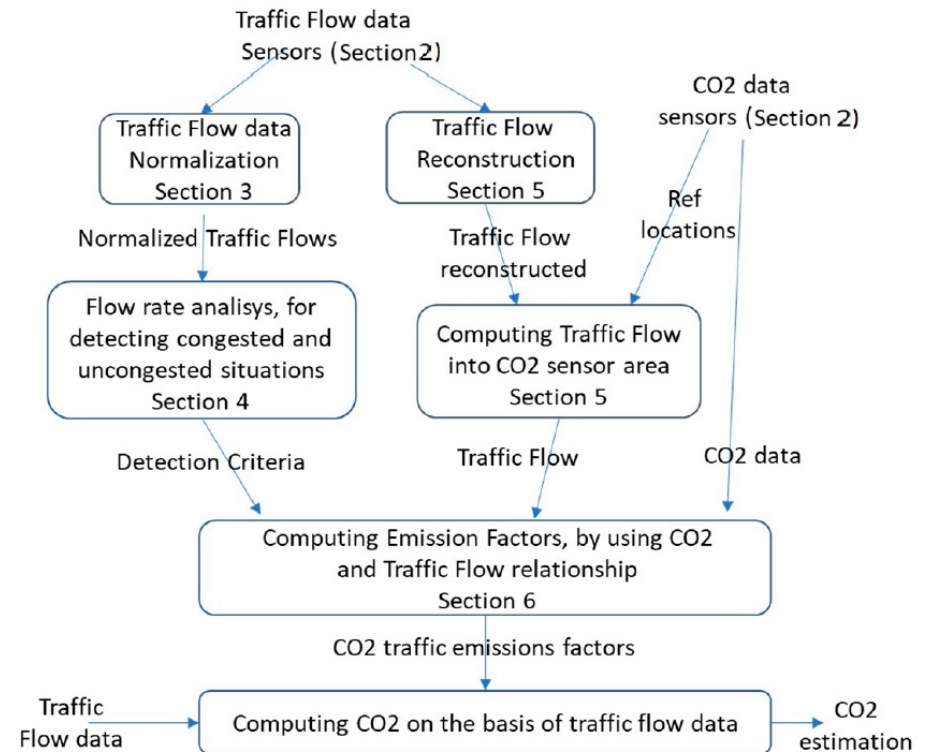

BASED ON VEHICULAR TRAFFIC

- CO2 emissions at major activity hubs within the city are estimated by leveraging:
  - Reconstructed Traffic Flow, and
  - Air Quality Sensor data.
- The analytical model for this utilizes the model created for traffic reconstruction and air quality station data to generate current and predictive heat maps for CO2.

# ANALYTICAL MODEL

- Traffic flow reconstruction algorithm applied to estimate traffic volume in segments closest to the identified air-quality sensors for validation.
- CO2 production is computed by considering several factors and efficiency aspects of the population of vehicle engines, heating, industries, etc.
- The matured model will consider weather conditions and the influence of the propagation of emissions based on wind and humidity.

# IDTCITIES IN THE REAL WORLD: PRACTICAL USE CASES

**solutions**

---

## **IDTCITIES APPLICATIONS SNAPSHOT:**

### **Smart City Infrastructure and Management:**

- Traffic Flow Prediction and Improvement
- Historical Analysis for Traffic Flow Reconstruction
- What-If Analysis for Construction Redirects
- Visualization of City Traffic Flow
- Decision-Making for Public Services, Resource Allocation, and Policy
- Vehicle Location Tracking
- Integrated Alerting System with IoT Applications

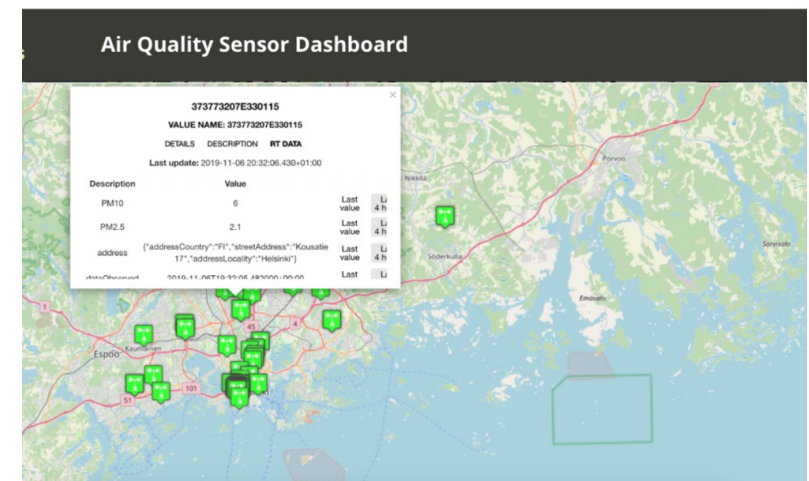

## Environmental Insights:

- Predictions for NOX and Air Quality
- Monitoring Energy Consumption
- Cost-Saving Efficiency Measures
- Advanced Waste Management
- Decision-Making for Environmental Conditions
- Innovation Opportunities for Businesses and Entrepreneurs
- Environmental Conservation Efforts through Data Monitoring and Analysis

## Economic and Educational Development :

- Innovation Opportunities for Businesses and Entrepreneurs
- IDTcities as a Learning and Research Tool for Educational Institutions

# OUR APPROACH

The logo for idT, featuring the lowercase letters 'idT' in white on a dark grey square background. The letter 'i' has a small yellow dot above it.

solutions

---

## THE APPROACH

- First, the captured data through IoT Broker connectivity and IoT App logic will be validated (via CKAN) and ingested into Azure.
- Ingested data is immediately indexed, searchable, and usable for IDTcities tools such as the Data Inspector, Big Data Analytics, Dashboards builder, Smart City APIs, and Mobile Apps, via MicroServices for IoT Applications (IoT Apps, Node-RED).
  - These are used for integrations, data transformation, and business intelligence, among others.
- Data will be consumed by data processing/data analytics, IoT App/integrations, mobile App, Dashboards, and Synoptics, in real-time streaming, known as data-driven processes, ensuring end-to-end security (from devices to dashboards, in both directions).

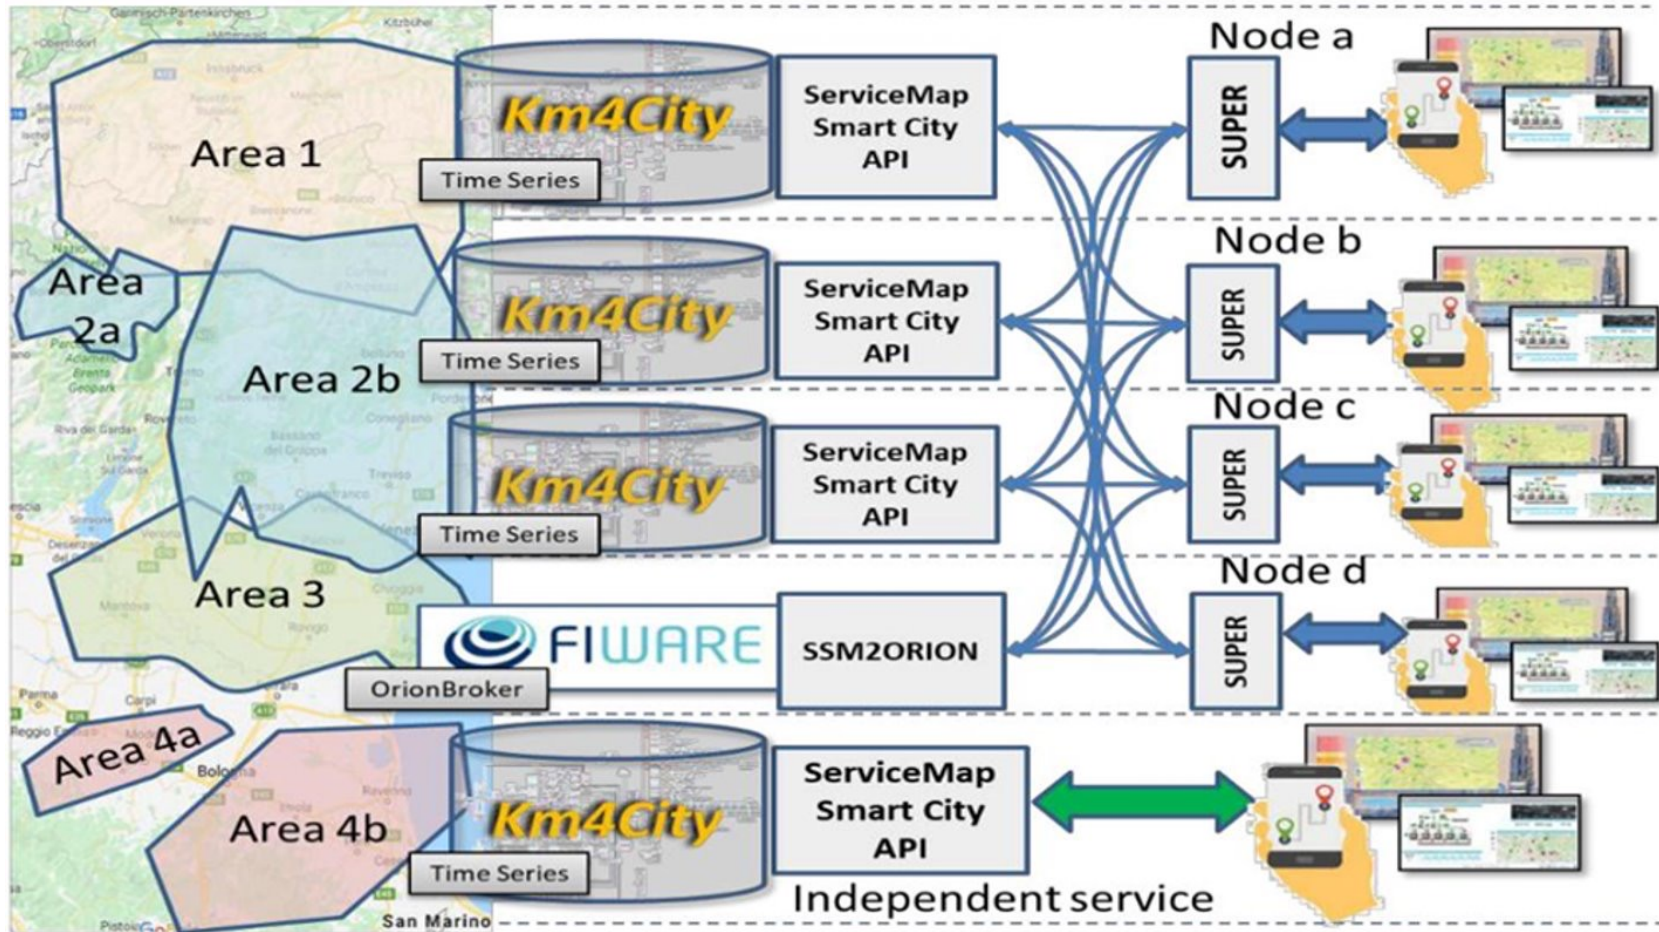

---

# REPORTS & BUSINESS INTELLIGENCE

*Reports & BI can be built by users with no-code and generated on demand.*

- We recommend using static data ingestion to save time. Configuring the IoT broker for the first time may take longer due to dependencies on the participants' end.
- Static data can be directly uploaded into the 'Data Storage and Application Hosting' layer.
- Once the data is uploaded, it becomes readily available for processing by Data Analytics, Data Inspector, Smart City APIs, and Dashboard Builder.
- The provisioning of an IDTCITIES.AU PaaS/SaaS instance for a customer typically takes **5 business days**.
