

Moderne[®]

The agent tools company

Agent-driven development is reshaping how software gets built, shifting the constraint from developer time to the efficiency, accuracy, and governance of coding agents. Moderne is the Agent Tools company that provides the persistent code intelligence, fast search, and deterministic execution tooling agents need to understand complex systems and deliver change safely at scale.

Moderne Agent Tools

AGENT INFRASTRUCTURE

Prethink knowledge base

Access precomputed code knowledge built from compiler-accurate semantic data—agents begin with reliable context instead of reconstructing it, reducing time and token usage.

Trigrep code search

Run high-speed code discovery delivering context in sub-second time so humans and agents both can work faster and more efficiently—and focus where it matters.

Semantic code search

Gain portfolio-wide semantic visibility—mapping services, data flows, dependencies, and API impact across repos while surfacing compliance gaps and cryptographic risk.

Recipe authorship

Create deterministic recipes (straight-forward tools agents can build) to execute reliable, efficient, repeatable actions across multi-repo codebases.

ENTERPRISE APPLICATIONS

Migration engineering

Automate major framework migrations across codebases and consolidate the tech stack (e.g., after M&A, org changes, etc.).

Security remediation

Identify and upgrade vulnerable dependencies (direct and transitive), fix OWASP Top 10 vulnerabilities, find secrets and Post Quantum Cryptography (PQC) anti-patterns.

Cloud migration

Modernize apps to move to a cloud provider from on-premises and consolidate on cloud native tech (e.g., Datadog to Azure monitoring).

AI usage governance

Inventory AI models, libraries, and agents across your software portfolio, monitoring usage patterns to support compliance, cost control, and approved standards.

PORTFOLIO COORDINATION

Changelog

Centralized control panel for software changes across teams and organizations—enabling multi-repo visibility on workflows for agents and humans, as well as approval actions.

DevCenter

Progress (and history) of migrations/upgrades, security profile, and change campaigns, helping humans and agents execute aligned, governed portfolio updates.
