Disaster Recovery on Azure

Enables the recovery of your critical workloads in case of an outage.

THEMA consulting

IT and services company / Lugano (CH) /
11-50 employees

THEMA Consulting provides treasury and risk management solutions for banks, corporate treasuries, and asset managers, with the objective of harmonizing their naturally complex operating models.

"For our workloads, it was critical to be able to recover from any type of incident. It was also critical to be compliant with the financial regulatory boundaries. We were able to start up our new environment in a matter of hours and test that everything was working as expected."

Fabio Ermiotti
Chief Technology Officier THEMA Consulting SA

THE CHALLENGE

The project aimed to protect THEMA Consulting SA and create a new level of availability for their internal and external services. The customer needed the assurance levels that Azure's infrastructure and solutions can provide to recover from incidents and outages.

THE SOLUTION

The Moresi.com solution, based on Azure Site Recovery, enabled THEMA Consulting SA to protect their physical and virtual workloads and let them test the failover mechanisms. It also allowed the customer to failover single VMs or applications in case of a partial disaster.

THE BENEFITS

Azure Site Recovery protects workloads, no matter where they run, helping the IT department to have a recovery plan and the freedom to quickly protect new servers, being sure that they'll be available if necessary. Freeing from over complicated recovery systems, the solution enabled them to easily keep track of the synchronization status and create hassle-free automations to start the environment in the right planned way.
