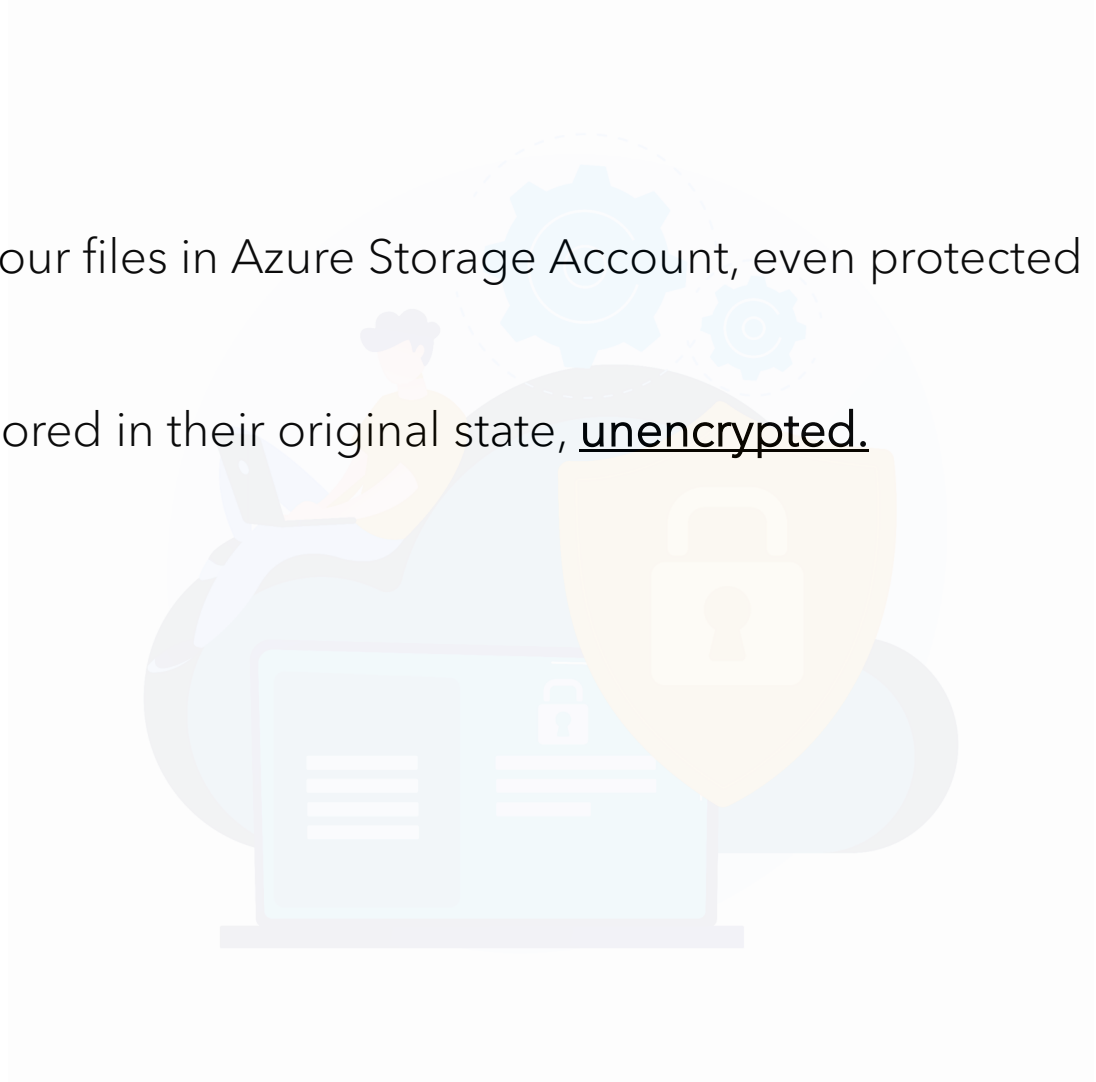
My files in cloud are totally safe?



Do you ever think that your files in Azure Storage Account, even protected by password, could not be totally safe?

This because they are stored in their original state, unencrypted.

What does YCRYPTO do?

YCRYPTO is an API developed by Mult-Connect, and through it you can save and retrieve your files in any Azure Storage with the following advantages:

The storage URL is not displayed anywhere;
Files are stored using encryption;
Both the file name and its contents are encrypted.

As a result, not even a user with full access to the storage can access the information.

Want an extra layer of security?

In addition to cryptography, YCRYPTO has an Artificial Intelligence resource, through which your company can register protection terms, which are:

Block Terms - Terms that will prevent the upload, if found in the document;
Alert Terms - Terms that will issue an alert, but storage will be performed.

Our product has no interface, and fully accessible via API.

What kind of company needs YCRYPTO?

Every company that want to have maximum security in the cloud and cannot take risks with improper access to their information.
