Introduction to Netwoven's Microsoft 365 Tenant-to-Tenant Migration service
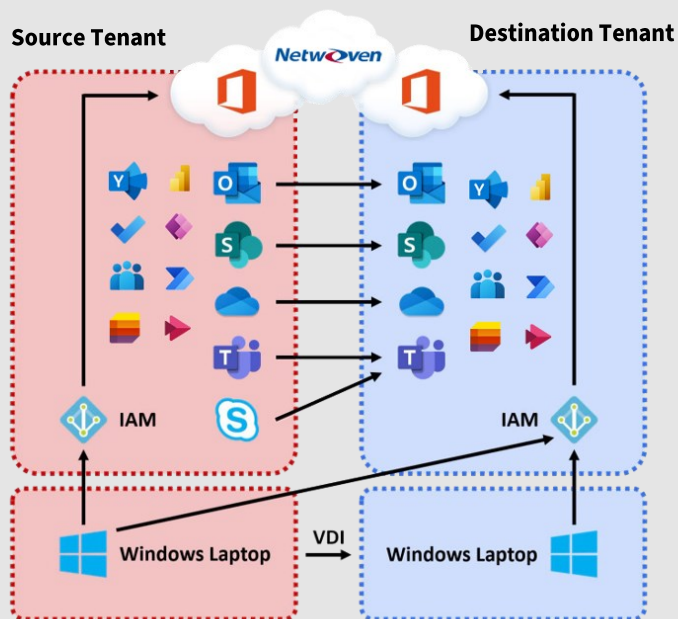

As more and more organizations undergo mergers, acquisitions, or divestitures, it becomes necessary for them to combine, relocate, or consolidate their IT infrastructure. To achieve this, a Microsoft 365 tenant-to-tenant migration must be executed, whether to merge multiple tenants into one, or separate one tenant into two. Syndicated tenants can also be migrated to a Microsoft tenant. Some scenarios where a company must merge, split, or migrate Microsoft 365 tenants are when it:

- Sold a business unit and its brand identity
- Sold a business unit, and the business unit will adopt the target company's brand
- Must split users across two tenants
- Is required to store part of its data in a separate tenant (GCC high, or Geo-located)

Netwoven provides a robust framework and the right set of tools for executing your migration projects successfully with zero data loss and downtime.

Advantages of using Netwoven's Microsoft 365 Tenant migration service

- **No downtime and data Loss :** With the tools and robust processes, the risk of any data loss is eliminated.

- **Reduced risk due to robust migration framework and a suite of tools :** Netwoven has been in migration since 2003. Our robust framework ensures that your project is completed on-time and on-budget
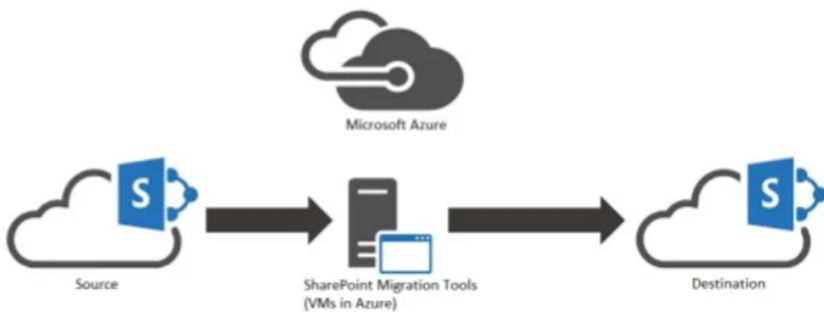

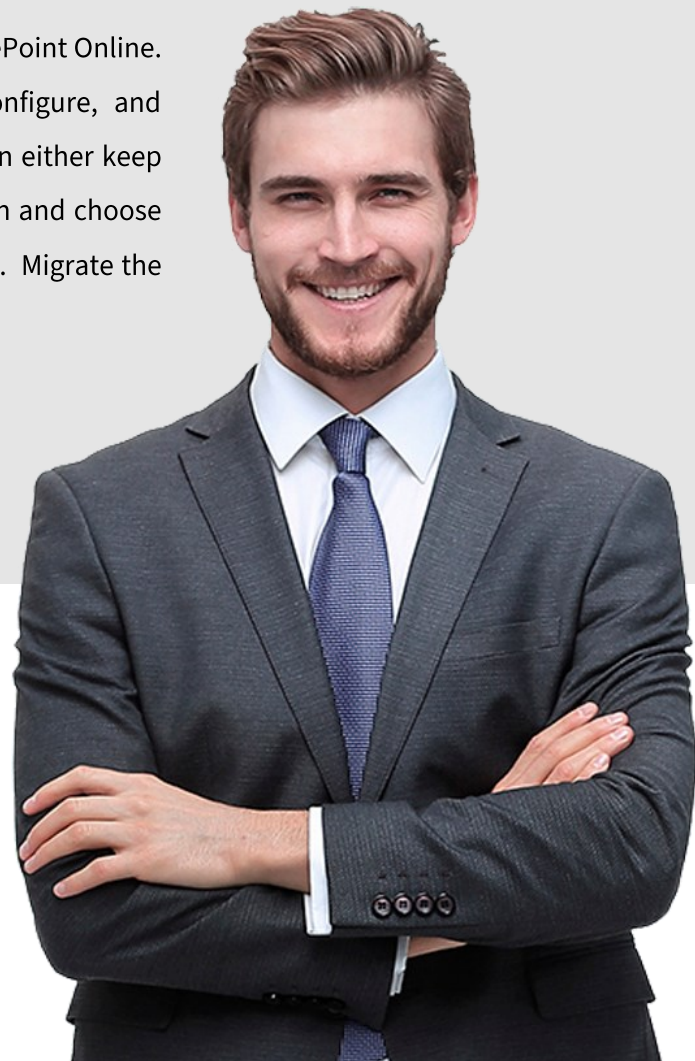

Features of Netwoven's Tenant migration service

Microsoft 365 Mailboxes: Speed up email migration between Microsoft 365 tenants, quickly and securely. We migrate the following artifacts:

- Mailboxes (emails, contacts, tasks, folders, inbound rules, notes, etc.)
- Distribution lists
- Shared mailboxes are recreated and migrated
- Primary/secondary calendars
- Rooms and equipment
- Permissions and delegations on mailboxes and calendars
- In-place/online archives
- Personal team chat messages are migrated with a mailbox migration license
- Litigation hold folders

OneDrive: Migrate from OneDrive to OneDrive or OneDrive to SharePoint Online. We provide auditing and reporting tools to help you plan, configure, and seamlessly migrate content through a single user interface. You can either keep or overwrite existing files at the OneDrive or SharePoint destination and choose whether you want to migrate metadata such as file creation details. Migrate the following artifacts:

- Files of all types
- Permissions
- Metadata

Microsoft Azure

Source — SharePoint Migration Tools (VMs in Azure) → Destination

SharePoint Online: Netwoven Netwoven leverages the most advanced Microsoft technologies and APIs for quick and seamless migrations. The built-in powerful features and flexible options allow you to maintain data integrity, permission levels, and metadata. The tools provide both auditing and reporting capabilities that assist you in planning, configuring, and migrating content through a single user interface. Artifacts include:

- Top navigation bar
- Quick launch bar
- Permissions
- Site structure
- Welcome page
- Metadata
- Libraries (document libraries, generic libraries & more)
- Content types

- Discussion boards
- Announcements
- Webparts
- Microfeeds
- TermStore (Taxonomy)
- Composed Look (included in SharePoint Foundation)
- Web fields (columns)

Microsoft Teams: Migrate your teams content using the Netwoven's team migration tool. Migrate the following artifacts using the tool:

- Channels
- Groups Memberships
- Conversations history
- Wiki
- Memberships roles
- Attachments

- Permissions
- Groups
- Files
- Planners
- OneNote tabs

Microsoft 365 Groups: Using the Microsoft 365 Groups migration tool, migrate Microsoft 365 Groups files from one Microsoft 365 tenant to another. Migrate the following artifacts using the tool:
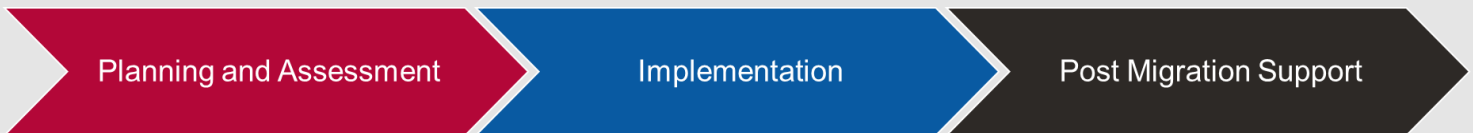

- Groups Memberships
- Conversations content
- Memberships roles

- Answers
- Attachments
- Metadata

Tenant Migration Background and Challenges

✔ Mergers, Acquisitions, and Divestitures may require an organization to merge, split, or migrate Microsoft 365 tenants

✔ Several business scenarios exist that will need to be supported

  A company sold a business unit and its brand identity

  A company split users across two tenants

  A company stores part of their data in a separate tenant

✔ Several M365 workloads are intertwined and require coordinated migration

✔ User experience can be challenging the longer one lives in a co-existent world

✔ Licensing overlap costing the company extra
