Authentication as a service:
No more stress – passwordless

Authentication Cloud – faster, easier and more user-friendly

The driver for innovation is digitization. Secure and easy access to digital offers and services plays an important role in its success.

With the Nevis Authentication Cloud you can offer your customers maximum security and a smooth user experience in no time. Available as an app with custom branding.

The biggest security risk is the password

It is a fact: passwords meet the security requirements no longer. In particular when it comes to mobile devices, where users often refrain from using special characters or long passwords. What's more, the majority of security breaches and attacks are due to stolen passwords. And many attacks occur at the end points, namely mobile or other devices.

Authentication of the new generation

Remembering a long, complex password for each of your accounts is no longer compatible with today's fast, mobile world. New solutions with passwordless authentication such as fingerprint or face ID are not only faster and more convenient, but also significantly more secure for everyone involved. Because they eliminate the primary target of hackers: the password.

What is it all about?

Today, the use of SMS-TANs results in high transaction costs. In addition, this type of authentication isn't really user-friendly.

By means of a branded smartphone app and a cloud-based software solution, your customer can log in securely and conveniently – free of charge and without a password. The end user can also confirm sensitive transactions.

Passwordless authentication

The combination of biometric identification and strong cryptography based on the FIDO standard makes authentication easy and secure for users. Their access data is stored in a secured area of the smartphone and never leaves it.

This protects the user's privacy and companies against potentially business-threatening security breaches during login. Both browser-based and app-based login processes are supported. This means that you can offer your customers the same convenience with maximum security on every type of device.

"The password is the biggest security risk. Get rid of it. User-friendly, secure and legally compliant."

The cloud authentication solution by Nevis

Don't compromise between user convenience and data security. Adapt the new authentication standard now and go passwordless.

Passwordless

Replace passwords with fingerprint or face recognition technology.

When passwords are eliminated, common hacker attacks such as password-guessing, credential stuffing and phishing attacks can be prevented. This is possible thanks to our biometrics-based approach for user authentication.

Integrating the Authentication Cloud into your registration and login process allows you to meet your customers' expectations in terms of data security and privacy with little effort. All without unnecessary friction or squandering time in trying to change the users' behavior.

At the same time, you benefit from the highest security standards thanks to FIDO certification and end-to-end encryption.

Brandable

Provide a seamless and consistent user experience thanks to a fully brandable access app.

Our highly skilled engineers developed a biometrics-based mobile authentication app. True to our Nevis values and with 30 years of experience in securing the most sensitive systems and data from government institutions and Swiss banks.

While developing the app, the emphasis was put on creating an intuitive and convenient user experience. This will help keep your users engaged over multiple channels and increase your conversion rate.

Furthermore, the app's front-end can be completely branded and adjusted to your corporate design. This gives you the advantage of a consistent brand appearance across all channels and the possibility to differentiate yourself from your competitors.

Cloud-based

Integrate this out-of-the-box, cloud-based software solution with just a few clicks.

Because we care about data security, we decided to not only offer the passwordless login to our existing, very security-conscious customers. Our solution is industry- and company-independent and can be easily integrated.

Thanks to powerful REST APIs, extensive documentation and quick start guides, the Authentication Cloud can be integrated into your existing customer identity and access management system in no time at all.
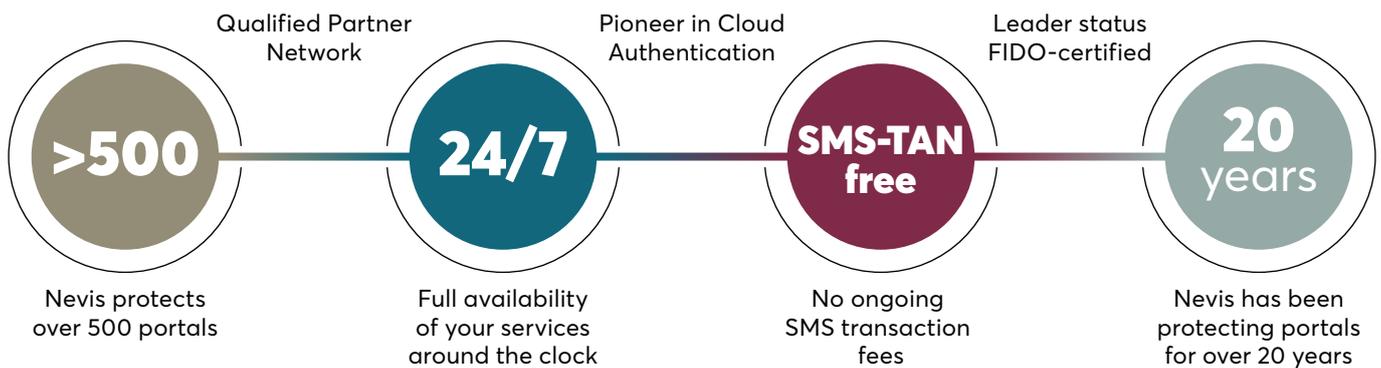

Use the Nevis Authentication Cloud. Improve the customer experience and accelerate the acceptance of mobile solutions. Increase security and reduce fraud. Cut costs by eliminating support requests.

Take off with digital security

Both browser-based and app-based login processes are supported. Thus you can offer your customers the same comfort with maximum security on every type of device.

- Protect your customers from data and identity theft

- Easily comply with legal requirements for sensitive user data (DSGV, PSD2, GKV-SV, etc.)

- Based on the FIDO standard and certified by the FIDO Alliance, the world's largest ecosystem for standards-based, interoperable authentication

- Fast integration of the Nevis Authentication Cloud into your IT environment

- Computer center either in the EU or Switzerland

- Integration of biometric features

- Significantly better usability, especially for mobile applications
