

2-Day Virtual Workshop

Azure Monitoring

NewWave offers a 2-Day Workshop to provide everything a cloud professional needs to monitor an environment in a cloud-space like Azure. Students will understand how to manage the resources used by your business in your cloud-deployment model to drive up efficiency and keep costs as low as possible. We will cover topics such as setting up the resource logging needed to track everything during run-time and setting up the alerts to notify you when something is wrong. We will also dive deeper showing students how to set up automated alerts, so it becomes a standard to deploy when setting up a new environment for projects.
