Track & Monitor

Key Functionalities

noema AI

Assistant

Configuration parameters based on business context. This will allow to design domain specific assistants with access to relevant data source. (Ex: HR Assistant, Finance Assistant, Loan Assistant...)

Data Ingestion

Ingestion of all type of data sources including unstructured files, scanned documents, tabular data including relational DB, websites and more.

Data Container

Configurable data containers that will allow to configure user access on detail object level.

Your chatbot, your data. With access only to the information you provide, ensuring complete control and security

Key Functionalities

Transparency & Output Accuracy

To ensure that every output can be validated by the user, the solution include a confidence percentage, data source references and technical log for each query.

Centralized User Interface

An intuitive and centralized user interface that will allow to interact with any assistant based on user access and authorization. The solution allows users to query structured, unstructured, visualization and actions

Track & Monitor

Track each assistant usage and monitor the accuracy of the output. Ability to measure user adoption and statistics around most asked information/service. Collect feedback on the accuracy of the output and how relevant was it to the user query.

Your chatbot, your data. With access only to the information you provide, ensuring complete control and security

1

Out of the box AI use cases that covers multiple industries and functions

2

Ability to interact with all your enterprise data to retrieve business insights, automate business crucial functions and use actionable agents.

3

An agile platform that accelerate the design and deployment of enterprise AI use cases.

4

Evidence based output is a core functionality to understand the accuracy, reference and logic behind each output.

Capabilities & Technology

Built on Microsoft Azure

Noema.ai is a native Azure Saas solution. Using Azure AI services allows to scale up when needed.

Scalable, configurable architecture and inbuilt security fucntionalities

A strategic solution with the ability to connect to multiple type of source systems. Ability to configure data ingestion, LLM selection & parameters, assistants & output, user security &authorization and much more

Enterprise Grade

A platform that enables you to design, deploy and scale up all your AI use cases in one place. This will help in reducing redundancy, centralized security and a single stop shop for users.

Intuitive Visualizations & User Experience

The solution provides state of the art user interface and dashboards for intuitive user experience. This include the power user and the end user interfaces.
