

Aspects of Business Value

More than just a business case.

A Business Value Assessment goes beyond cost savings. It provides a 360° view of the potential your organisation can unlock by using public cloud in its IT landscape.

IT infrastructure cost savings

Moving to public cloud unlocks potential savings on IT infrastructure and other related costs, e.g., licenses.

Using a cloud-native approach to provisioning adds further savings potential by reducing use of compute, storage and/or networking resources.

IT productivity gains

Cloud infrastructure is a sweet spot for automation and DevOps practices, making it easier for you to benefit from them. Extensive support also helps you leverage tools and platforms.

The result: higher productivity.

IT operational gains

Cloud infrastructure is generally backed by highly efficient, technically advanced and secure data centres supported by global operations teams.

You save by harnessing your cloud service provider's economies of scale and scope for providing secure, available and truly global environments.

Business gains

As well as providing savings and efficiency gains, public cloud also enables and supports the development of new business capabilities.

This not only leads to greater potential savings, but, more importantly, better and faster value creation.
