

Seamless Integrations

Chat Interphase

Multi-steps Workflows

Boost security and productivity with powerful automation

Kick-off Software Upgrades

Manage Incidents

Generate Reporting Data

and much more...

choice of automation by cybersecurity companies

opsbeacon automation is preferred by large cybersecurity companies like Safe Security and Virsec to streamline their operations.

“OpsBeacon significantly streamlined and automated our operations, driving a mindset change towards automation across the team. I would highly recommend opsbeacon as an essential tool.”

Oliver Moore
Vice President – Global Technical Operations at Safe Security

automate anything

opsbeacon enables a wide range of users to perform standard operational tasks in a controlled and repeatable manner.

Any task, either simple or complex that has one or more steps that needs to be executed on one or multiple platforms can be reduced to one chat command or a predefined recurring action.

set up once and relax

opsbeacon offers a wide range of integrations to other tools and platforms like AWS, MySQL, Jira, OpsGenie, ServiceDesk, RestAPI, GitHub, Slack, PagerDuty among others.

Tasks are created by turning scripts, API calls, DB queries to commands and by joining commands to workflows.

Commands can be performed on any integrated platform. There are no limits to how many commands can be joined into a workflow. This allows running very complicated and time consuming tasks with only one chat message.

Events can be triggered by incidents, alerts, API or chat. Regular events like deployments, maintenances can be automated by cron jobs.

get things done securely

With opsbeacon nobody will need to access to production. Period.

This is an essential component of **zero trust** system architecture for security.

Your team will execute predefined tasks in a fast and secure way eliminating **human error**.

The range of tasks is limited only by your imagination.

For starters, you can kick-off software upgrades, restart servers and apps, run tenant provisioning, manage incidents, update user accounts, extend customer license, generate reporting data, onboard or offboard employees with just one chat message.
