

Omnistrate Getting Started Guide

Launch Your First AI Agent or Cloud Application on Azure

Includes a 30-Day Free Trial

1. Welcome to Omnistrate

Welcome to the Omnistrate Platform! You're just a few steps away from launching your first B2B AI Agent or Cloud Application.

Omnistrate is a "Control Plane-in-a-Box" that automates the undifferentiated heavy lifting of building and scaling B2B applications. Instead of spending months on infrastructure, you can now focus on your core IP.

This guide will walk you through the first-time setup on Microsoft Azure, from signing up for your **free 30-day trial** to deploying your very first application. In about 10-15 minutes, you will have a fully managed service running on your own Azure subscription.

2. Before You Begin

To ensure a smooth setup, please have the following ready:

- **An Active Azure Subscription:** You will need an account with permissions to create resources (like resource groups and service principals). Omnistrate will run *inside your subscription*, so you always maintain full control of your data and environment.
- **An Application Artifact:** This is the application you want to deploy. Omnistrate supports a wide range of artifacts, so you can start where you are:
 - **Source Code Repository:** A Git repo (GitHub, GitLab, etc.) with a `Dockerfile`.
 - **Container Image:** An existing container image from any public or private registry.
 - **Docker Compose:** A `docker-compose.yml` file.
 - **Kubernetes Artifacts:** Your existing **Helm** charts, **Kustomize** configurations, or **Kubernetes Operators**.

- **Terraform:** Your existing **Terraform** modules.

3. Your 4-Step Quickstart Guide

Step 1: Sign Up for Your Trial

1. Navigate to the [Omnistrate Listing on the Azure Marketplace](#).
2. Click **Get It Now** and follow the prompts.
3. You will be redirected to the Omnistrate platform to create your account. This automatically begins your **free 30-day trial** with full access to the platform.

Step 2: Connect Your Azure Cloud Account

Once you are in the Omnistrate dashboard, you'll be guided to connect your cloud account.

1. Select **Azure** as your cloud provider.
2. Follow the secure, guided onboarding wizard. This process will have you create a Service Principal in your Azure account that allows Omnistrate to provision and manage resources on your behalf.
3. Your data, applications, and infrastructure never leave your own Azure subscription.

Support Link: For a detailed walkthrough of this step, see the [Azure Onboarding Guide](#).

Step 3: Define Your Service

Now, let's tell Omnistrate *what* to run.

1. From the dashboard, select "Create New Service."
2. Point Omnistrate to your application artifact (e.g., your Git repo, container image, or Helm chart) as defined in Section 2.
3. Configure your service parameters, such as the service name, the Azure regions you want to deploy to, and any required environment variables.

Support Link: Learn more about service definitions in our [Creating Your First Service](#) documentation.

Step 4: Deploy & Manage

1. Click **Deploy**.
2. That's it! Omnistrate's control plane now handles all the heavy lifting: provisioning the underlying Kubernetes clusters (if needed), setting up networking, and deploying your application.

3. **Congratulations!** Your application is now live. From the Omnistrade dashboard, you can now manage tenants, monitor usage, automate metering, and view logs from a single control plane.

4. Where to Get Help

Your first service is just the beginning. Now you can explore the full power of the Omnistrade control plane.
