
**Application Migration
Assessment**

**Migrate your
applications to the
cloud to maximise
scalability and
reliability.**

Moving your application workload to the cloud offers potential cost savings and improvements in scalability and reliability while also providing accessibility to any users with an internet connection.

Smooth migrations that deliver on promised benefits and provide a better end-user experience depend on the migration process and cloud environment being optimised for your business objectives.

Our Application Migration Assessment helps you get the best outcome, whether you're moving application workloads from on-premises infrastructure, private clouds, between cloud providers or to new cloud services. The assessment considers such factors as:

Assessment Workshop

The assessment is delivered through a workshop to assess the readiness and feasibility of your cloud migration, and identify potential risks or challenges that may need to be addressed. We work with your team to uncover all aspects of your current application infrastructure and your business objectives that will affect the migration process and solution.

Recommendations

Following the workshop, we will produce a report with recommendations for planning, preparation, implementation, testing and optimisation. Recommendations may include options from rehosting without modification, to refactoring, rebuilding, replacing, retiring or retaining elements of your application infrastructure.

Follow up

The report creates a roadmap for work that will deliver the best application migration to meet your goals. On request we can then create a Statement of Work for any of the recommended actions, covering such items as designing the core components for a secure and scalable cloud environment to host your applications, the cloud migration plan, disaster recovery planning and optimisation work.
