
Architecture Assessment

**Optimise
your Cloud
Environment
for growth.**

As your business grows you need to ensure that your cloud environment is aligned with your business strategy and is ready to scale.

Businesses of different sizes have differing needs from their cloud solution. The first step to planning for growth is to understand your needs and the capabilities of your current environment.

Our Architecture Assessment is designed to assess both your cloud environment and your business strategy and provide recommendations for ensuring the two are in sync. Our team work with you to evaluate the design and implementation of your cloud environment and produce recommendations to:

Assessment Workshop

The assessment is delivered through a workshop to assess the design and implementation of your cloud infrastructure considering factors such as scalability, disaster recovery, and high availability and how these align with your business strategy.

Recommendations

Following the workshop we will produce a report with recommendations for improving scalability, reliability, and security including any necessary modifications to your cloud environment's architecture, processes, or tools.

Follow up

The report creates a roadmap for optimising your cloud solution. On request we can then create a Statement of Work for any remediation work or a full architecture project to redesign your solution to meet business goals. This may include the design and implementation of new services such as a Web Application Firewall for improved security, high-availability architecture for improved reliability, caching and content delivery network for improved performance and a disaster recovery handbook for improved business continuity.
