**DevOps Maturity Assessment**

**Improve customer  
experience through  
better DevOps  
delivery.**

---

When your business depends on your ability to continuously deliver improvements to customers, bottlenecks in your DevOps pipeline can impact your bottom line. As your business grows ensuring your deployment are able to keep pace and deliver results through appropriate practices and processes is essential to avoiding speed bumps in your growth.

Our DevOps Maturity Assessment is designed to help you evaluate the efficiency of your development and operations teams, your processes and your tools and help you identify areas for improvement so you can be sure your DevOps capabilities are where they need to be to sustain your business growth. The assessment examines such areas as:

## Assessment Workshop

The assessment is delivered through a workshop to develop a comprehensive understanding of the current state of your DevOps environment and practices. We work with your team to uncover all aspects of your DevOps pipeline, including production schedules, testing and quality assurance, application performance measurement, infrastructure management, security and compliance procedures, team and departmental collaboration, internal and external feedback integration, automation and tooling management, and measurement and reporting of key performance indicators.

## Recommendations

Following the workshop we will produce a report with recommendations for actions to improve your DevOps. These actions may include things like metrics and KPIs to provide better insight into DevOps delivery, benchmarking against industry standards, the implementation of Infrastructure as Code (IaC) tools or Continuous integration and continuous delivery (CI/CD) to improve management, provisioning and automation of infrastructure and deployment of applications, improvements to version control systems and scalability and reliability practices.

## Follow up

The report creates a roadmap for work that will deliver improved DevOps delivery. On request we can then create a Statement of Work for any of the recommended actions, such as a DevOps workshop to provide training for your team on best practices for continuous delivery and deployment and DevOps implementation work to design and implement software and IaC deployment pipelines with integrated automated testing.
