Microsoft Copilot Technical Readiness Proposal

Microsoft 365 (M365) Copilot is an AI-powered productivity tool that coordinates large language models (LLMs), content in Microsoft Graph, and the M365 apps that you use every day, such as Word, Excel, PowerPoint, Outlook, Teams, and more.
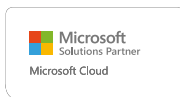

This integration provides real-time intelligent assistance, enabling users to enhance their creativity, productivity, and skills.

M365 Copilot uses your existing permissions and policies to deliver the most relevant information, building on top of existing commitments to data security and data privacy in the enterprise.

To evaluate your current environment and its readiness for the implementation of M365 Copilot, Phoenix will carry out a M365 Copilot readiness assessment, of which occurs in three phases:

Phase one	Phase two	Phase three
Discuss: Discuss Microsoft 365 Copilot requirements. Gain a common understanding of your objectives and requirements. Discuss the risks of implementing Copilot without the necessary compliance and data protection controls.	**Discover:** During this phase we will conduct a high level assessment and explore various aspects of your Microsoft Cloud in-place configurations.	**Review and plan:** Provide a review and recommendations/ RAG report which can be used to develop a high level roadmap and help your organisation develop a Microsoft Copilot strategy.

Next steps	
SharePoint: Where required, Phoenix will work with you to produce a Statement of Work to implement any changes required for M365 SharePoint.	**Purview Pilot:** If required, Phoenix can engage follow up sessions resulting in Statement of Works for implementation of the required controls.
