## Azure Files

Azure Files is a solution that allows organizations to deploy files share also over public internet allow easy access for users. It supports classic authentication with AD on-premises and alternately can support hybrid modern authentication on Azure AD.

You do not need any more to manage servers, keep them updated, complex cluster setup and so on, switch to PaaS (Platform as a Services) powered by Azure in a simple and scalable way.

### OUTCOMES

Conduct workshops to present, discuss and explore initial Azure Files solutions; design proposals and start with an essential implementation focus on make available a files share to the users.

We'll work with you to:

- Define and open Azure Subscription on our CSP if need.
- Choose the right type of storage for your needs
- Deploy the Azure Files resources, resource groups, etc.
- Setting up authentication and other service settings
- Explain how to set and manage permissions (on azure level and on file share level)
- Explain how to migrate any files from on-premise
- Deploy Azure Backup related to Azure Files and explain how to manage backup/restore of files.

### CAPABILITIES

Workshop to design and choice Azure Files storage type and learn how works

Deployment phase to deploy Azure Files with best practices

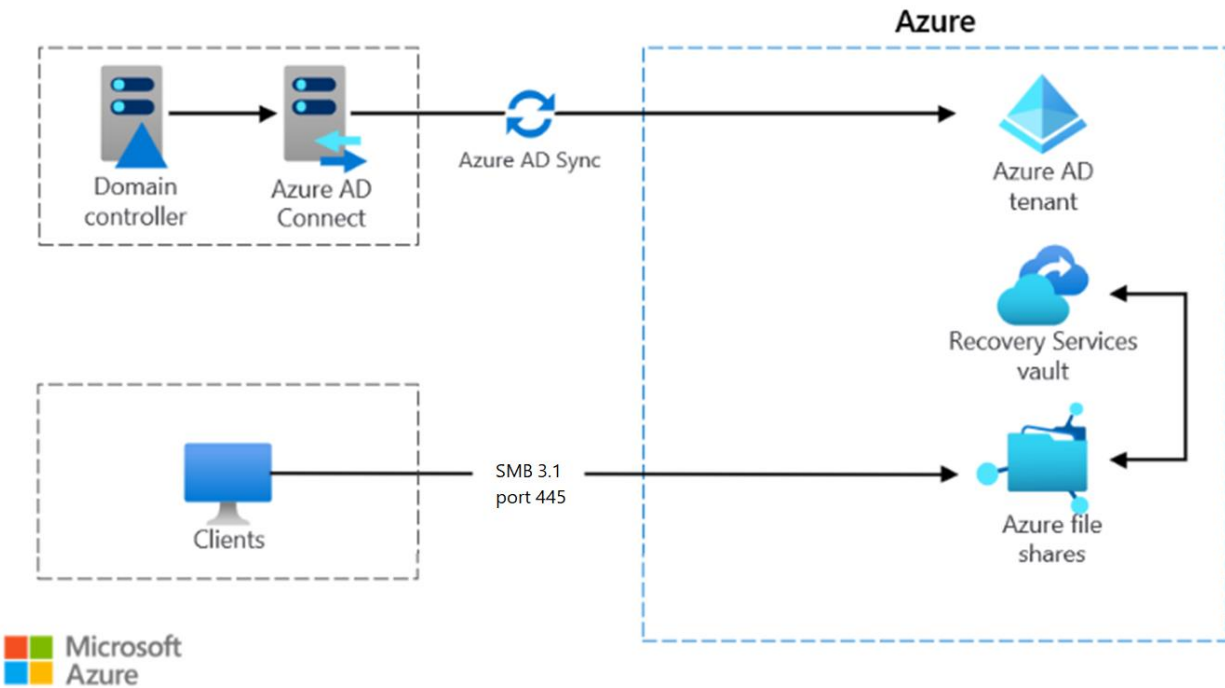

Start to operate with files share, manage permissions and manage backup and restore of files

Provide presentation to IT manager to explain design decisions, recommendations and next steps

# Duration: 1 Week
