Qbim analytics

About Qbim analytics

1.1. Purpose

Qbim analytics is a fully automated web service for visualizing and analyzing customers' data. The service handles the entire flow from data collection and data washing to ready-made analysis reports for the customer to take part in in a web portal.

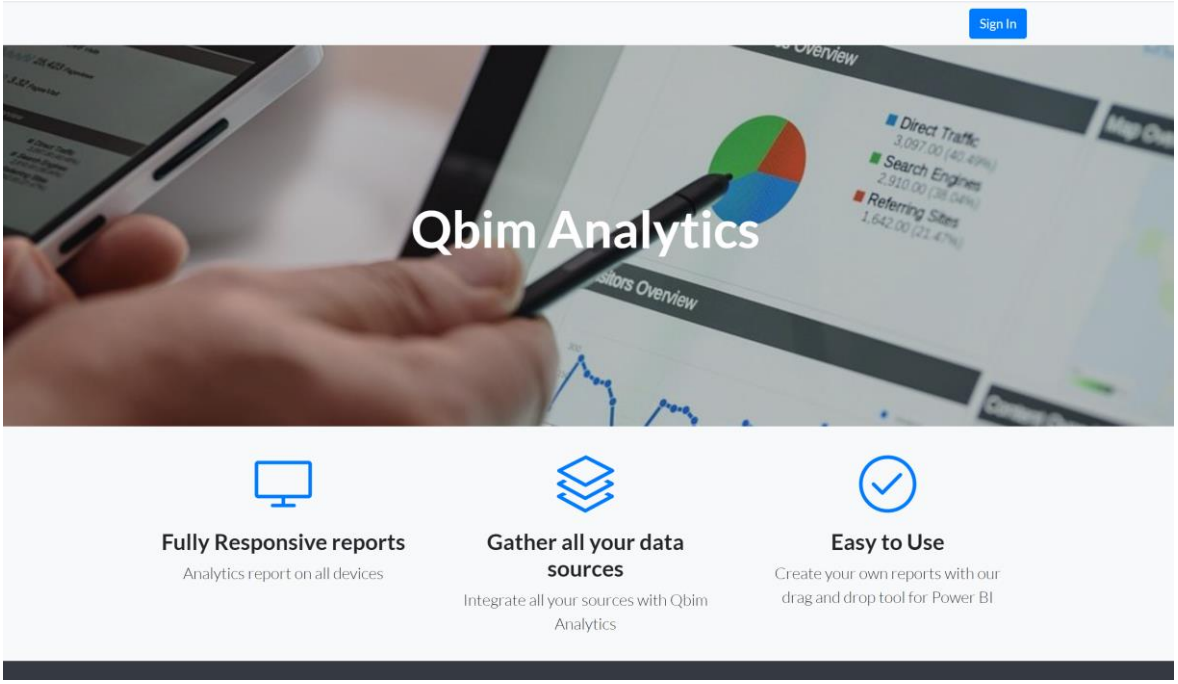
The goal is to remove all manual data administration from the customer and instead let them focus on improving the business through data-driven decisions.

Qbim analytics comes with a ready-made integration with the business system PengVin, which means that the work can be directly focused on what the customer's needs for follow-up and visualization in their reports.

1.2. Demo Qbim analytics

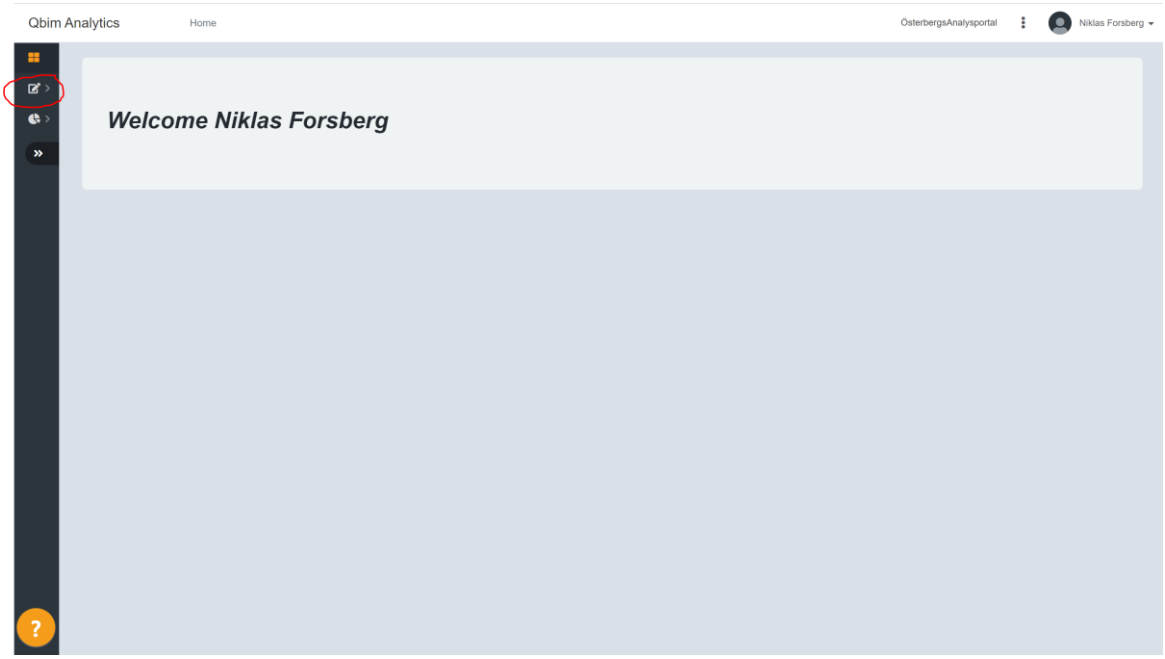
Below are some images from Qbim analytics and how the web service works.

Figur 1 – Login



The web service/analysis portal is accessed through the URL qbimanalytics.se. In the upper right, the user is asked to log in ("Sign in") and you do this with their regular work account.

Once you have authenticated, you will enter the analysis portal itself and its home page. On the left side of the menu system, you can then access your reports:



When you have then selected the report you want to look at, it is loaded and displayed:
