

Velocity Insights

Monitor, analyze, and prioritize .NET, JavaScript or Node JS errors in real-time - all on one dashboard.

Quisitive Velocity Insights is a tool created for anyone who uses .NET, JavaScript, or Node JS in their development stack. By connecting error logs, ticketing data and CI/CD (DevOps) systems, Velocity Insights aims to increase developer productivity and velocity so that users can focus on building the best business-critical apps.

Quisitive leverages Velocity Insights during our Velocity engagements, from the developer environment through to production, to integrate tickets, errors and application performance to provide a comprehensive view of the development project.

Product Overview

- Monitor, analyze, and prioritize .NET, JavaScript or Node JS errors in real-time on one dashboard.
- Detect errors early leveraging AI to identify which errors you should resolve first.
- Reduce time and resources and save hours per week per developer analyzing root causes.
- Get insights into each developer's capabilities and allocate team resources more strategically.
- Detect personal identifiable information (names, emails, password, SIN) and infrastructure secrets (connection strings to common Azure resources) leading into logs and get alerts sent to your team.
