

RadiusPlus

helps telecommunicators achieve new levels of real-time situational awareness in **five ways...**

2.

Side-by-side display of ALL locations and supplemental locations

Determine incident location and track callers in motion without manually entering their callback number.

Automatic map updates

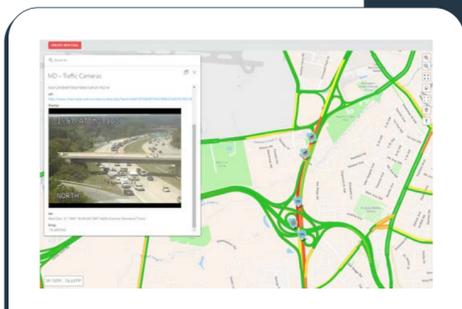

Map data is updated as soon as it's published by GIS, instead of waiting for weeks or months for someone to manually update the maps.

1.

3.

Easily connect with callers

Enable callers to easily share their location and what's happening on site during the incident via their mobile phone.

5.

All data feeds in one map

Spend less time looking at different maps with real-time traffic and incident data from TomTom and Waze, as well as real-time Weather data from DarkSky all within one map.

4.

Break down communication barriers

Communicate with non-native English speakers and with callers that are in danger, are hard of hearing, deaf, or speech-impaired, faster than ever and without conferencing in a third-party language translation service.
