Opportunity

## Réitigh ("Ray-tig") | To Solve

Our name Réitigh is an Irish verb meaning to solve, to elucidate, or to bring order.

This name reflects how we work daily with our clients to:

Solve challenges moving, storing, and processing data - by elucidating complex processes, breaking them down into simple units of work, then using our low-code framework "IntegraLynx" we work collaboratively with our clients to configure scalable, automated, and governed applications.

Bringing order to their back-office.

### WHO WE HELP

We work with the world's leading financial services companies to fundamentally change how they manage their data - enabling them to become resilient to change, and to achieve scale without increasing headcount.

# Integralynx.

Our low-code application development platform “Integralynx” enables Fund Service Providers to “application-ise” their back-office processes - delivering automation, scale, and governance. Bringing order to their data and how it is processed.

**Data Transmission:** Integralynx enables the collection and dissemination of information/files via multiple transfer mechanisms e.g email, SFTP, API, direct database connectivity.

**Data Import/Export:** Processes can be easily created to import/export data from/to a variety of file formats including excel, .csv, .txt, .xml, and .pdf. Data completeness and quality checks are applied as data is imported.

**Data Model & Storage:** Integralynx supports the efficient implementation of data models tailored to client’s precise business requirements. Objects, their characteristics/fields, and linkage to each other are all easily defined, reviewed, and managed through a user-friendly interface. The core underlying philosophy is to “gather data once and use it many times”.

**Data Processing & Calculations:** Leveraging data collected and validated Integralynx enables users to create complex calculation routines to produce and store new data.

**Oversight & Analysis:** Integralynx provides multiple approaches to reviewing, analysing, and visualising data consumed and produced - including in-built drilldown reports, .pdf templates, SSRS reports, and PowerBi dashboards.

**Workflow & Automation:** Having configured individual processes to collect, import, validate, and produce data, users can create scheduled and polling-based workflows to automate end-to-end processing

**Governance:** All access and activity within Integralynx is controlled through a fine grained and configurable roles-based user permission framework. Integralynx provides a built-in audit trail of all changes made to data and process configuration, with an extensive event log recording all user and system activity.

Integralynx has been configured to support a vast array of financial reporting, regulatory reporting, and administrative/operational processes - including: PRIIPs KID Management, MiFID II Cost Disclosures, CTI Cost Disclosures, Solvency II Asset Reporting, NAV Oversight, LDI Collateral Management, Master Data Management, 3rd Party Service Provider Questionnaires, and so much more.
