USE CASE & SUCESS STORY

SUCCESS STORY

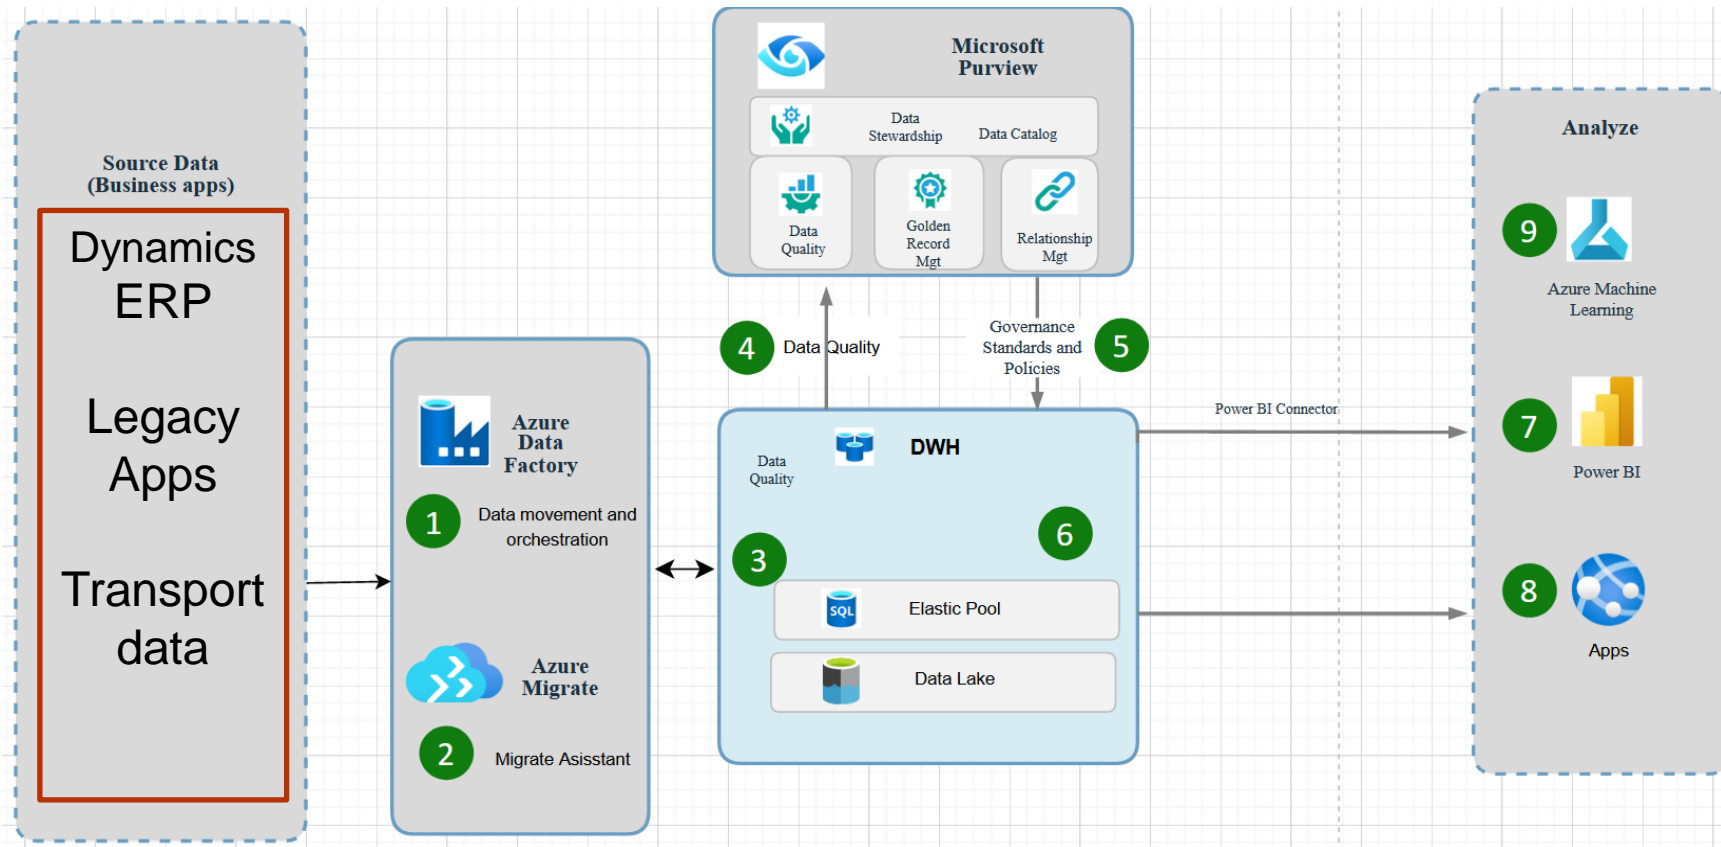

MODERN DATAWAREHOUSE & REPORTING PLATFORM

Client	LOGISTICS & TRANSPORTATION
Challenge	There is no daily updated data from all companies in the areas of land transport, air and sea freight, finance and warehouse management in order to establish a holistic view of all elementary business processes.
Solution	In this project, we aim to replace the client's existing BI architecture with a data and reporting platform hosted in the Microsoft Azure Cloud. At the core of the solution lies the development of a data warehouse using state-of-the-art Azure Cloud Native Services. For reporting purposes, Microsoft Power BI will be introduced. Given its scalability and expandability, the platform is designed to meet all future requirements, e.g., the use of AI or the integration of further systems if required.
Benefit	Harmonized and global data model and KPI definition Uniform reporting and self-service analyses
Technologies	Azure Purview Azure Data Lake Azure SQL Azure Data Factory Power BI Azure DevOps

AGILE IMPLEMENTATION

METHOD

PROJECT PRINCIPLES

Use Case oriented thinking

Development of new functionalities based on use cases

Incremental approach

Development of small, functional components (end-to-end)

Regular exchange

Regular planning, prioritization and acceptance of requirements

Fast Feedback

Early involvement of users and their feedback

Transparency

Regular communication of progress and challenges

ENVISIONING A MODERN REPORTING SOLUTION

DELIVERABLE

WORKSHOP

Preliminary talk

1
hour

Collect general information about customer processes , existing IT infrastructure and actual Reporting Landscape

Discuss actual data and reporting strategy

Identification of Pain Points

Discussion about potential Use Cases

Big Picture

2
hours

Investigation of existing data sources, IT infrastructure and Reporting

Definition of Reporting Goals covered by the MVP

Definition of use case for each field

Development of a common vision based on use cases

Roadmap

2
hours

Requirement engineering for use case
Specify technical prerequisites
Describe implementation strategy

Definition of MVP* based on use case

Create architectural design of the Reporting Landscape based on the requirements of the use case(s)

Development of a project plan

Results Call

TECHNICAL SOLUTION DESIGN

Solution Design and Project Plan

Our architects build technical design solutions according to established best practices in coordination with your requirements. We focus on the customer's specific needs and challenges in order to find the most optimal solution. Using the best tailored technology solution based on the Azure Stack, we combine data from all possible data sources and visualize it for further utilization. We use agile methods to deliver successful projects of various forms.

Implementation Use Case

All necessary Data Sources are connected to the Reporting Platform. Gateways are implemented to enable the Usage of onPrem Data Sources within the Cloud Reporting Service. Data is stored and structured in Dataflows within the Service to maximize accessibility. Entitlement to the data is easily managed. Taylor made Datasets are provided to the Users and fitted with unique cooperate KPI definitions. Prepared Data can be used by every entitled user to create own insights from the Data in a self-service process. Provided Data can be enriched by the user from several additional data sources, without affecting the underlying base datasets and KPI definitions. Visualization and distribution can be easily managed by the users themselves in numerous formats or can be managed centrally to keep control over the provided insights and data.

PROJECT PLAN

DELIVERABLE

BACKLOG

Roadmap - User Stories

An agile backlog not only simplifies release and iteration planning, but includes all tasks for a team. The Product Backlog consists of a list of items that need to be completed during the development of the product.

A well-maintained backlog provides complete transparency of tasks and planning for each team member. In addition, it opens full control over the tasks, the distribution and processing of tasks.

Workshop: +4.999€

Possible Deductions

Workshop with subsequent project: -4.500€

Discount on first 45.000€ project costs: -10% ~ 4.500€

Workshop Format

Preliminary Talk – 1h

Introduction of customer processes, contexts and reporting strategy. Discussing the pain points and Use Cases.

1

Big Picture – 2h

Overview of the existing data sources and IT infrastructure. Scoping the overall Reporting goal.

2

Roadmap – 2h

Identify the main technical prerequisites and architectural design for the implementation strategy of the MVP.

3

Results – 1h

Mgmt. summary for stakeholders to support a decision and presentation of solution design and roadmap for next steps.

4

Business Problems and Added Value

Unification: No consolidated view across multiple systems and data sources.

Harmonization: Data is not harmonized or is error-prone. Too many different KPI definitions.

Lack of automation: A lot of manual post-processing is necessary. Reports are created manually.

Time-to-Market: Turn time intensive development of new use cases into short termed solutions.

Lack of Know-How: Turn knowledge gaps into knowledge bases.

Time Delay: Eradicate time delays of current data and the business transactions to become visible.

Achievable by

Deliverable: Solution Design and Project Plan

Our Data Visualization experts build technical design solutions according to established best practices in coordination with your requirements. We focus on the customer's specific needs and challenges in order to find the most optimal solution. Using the best tailored technology solution based on the Azure Reporting Stack, we retrieve data from all possible data sources, visualize it and distribute it for further utilization. We use agile methods to deliver successful projects of various forms.
