# HMI-enabled asset performance management

In the realm of machinery, it is customary for every device to incorporate a **human machine interface (HMI)** to facilitate monitoring and control. By harnessing the power of FactoryTalk Optix as your HMI, you not only gain the ability to oversee and manipulate your asset at a local level but also the capability to transmit machine data to the cloud for enhanced asset performance management and enterprise-wide visibility.

Rockwell Automation

# Asset performance management

**Our HMI-enabled asset performance management solution** serves as a prime example of how the HMI can function as an edge device, effectively transferring valuable machine data to the cloud. By seamlessly integrating FactoryTalk Optix and Plex APM, you not only attain on-site awareness but also enterprise-wide insight into all of your assets.

This solution proves particularly advantageous for machine builders or situations where stand-alone equipment possesses limited capacity for additional hardware and/or software.
