

# Migrating Integrations to Azure Integration Services

## **Do you feel:**

*...that you have a need for migrations of your existing integration landscape?*

*...that you want to learn about the benefits of migrating to Azure (AIS)?*

*...that you need dedicate time and resources for PoC testing with our support?*

Welcome to our journey towards migrating your current integrations to Azure Integration Services (AIS)! This structured plan is designed to ensure a smooth transition, equipping your team with the necessary knowledge and hands-on experience. Here's what we have planned:

**Overview of Azure Integration Services:** Kick things off with an introduction to AIS, highlighting its capabilities and how it can transform your integration landscape.

**Startup Meeting:** We'll convene to align on team members, set key dates, and cover other logistics to ensure everyone is on the same page.

**Integration Review:** Together, we'll examine your existing integrations to identify patterns, technologies used, and any potential challenges.

**Design Sessions for PoCs:** For each selected Proof of Concept (PoC), we'll dedicate a half-day design session to lay the groundwork for successful testing.

**PoC Execution:** We'll select 3 PoC candidates for in-depth testing. Each PoC will run for 3 days over 2 weeks, allowing developers to manage their regular duties alongside. Daily standups will help us track progress and address any issues, with Solidify on standby to provide additional information and support.

**Bi-weekly Leadership Meetings:** Every two weeks, we'll catch up with your leadership team to discuss progress and tackle any strategic questions.

This delivery is scoped to be completed within 4 calendar months. Should you need extra hands, Solidify is ready to augment your team for the PoCs. Our goal is to not just introduce you to AIS but also to ensure your team gains practical experience and adopts best practices for a seamless migration.
