Upskilling Coach

R&D

Navigate product architectures, explore configurations, dependencies, and features across variants

Define and refine requirements, specify function realizations, and design and optimize components across variants

Detect SW and E/E errors early, ensure full traceability, and link issues to system dependencies

Monitor product maturity, track errors, ensure data quality and governance throughout R&D

Production

Generate assembly sequences and layouts, and align production requirements with R&D

Guide troubleshooting of SW and E/E errors in production by linking issues to system dependencies

Sync production line data with product data to gain full control over throughput, quality and error resolution

Provide live access to holistic product information and variant deltas, learning paths and guidelines

Aftermarket

Provide holistic product transparency for aftermarket product management, including repairs, SW and E/E issues

Generate repair sequences, workflows, and manuals, and manage spare parts across configurations

Resolve SW and E/E issues by linking errors to system dependencies and uncovering recurring patterns

Connect field to product data, providing variant insights, trace root causes and detect product issues early

Provide live access to holistic repair instructions and variant deltas, learning paths and guidelines

AI Agents

Develop & integrate complex products more efficiently with data in context

Problem

The development of modern, highly complex products and systems requires perfect coordination between relevant requirements and stakeholders. Misalignment and lack of transparency lead to inefficiencies, increased costs, delayed time-to-market, and compromises on quality.

Solution

Your R&D teams collaborate seamlessly, benefiting from real-time insights and transparent interactions across all product domains. By providing a unified suite that ensures both technical functionality and compliance, your team will be able to deliver high-quality systems more quickly and cost-effectively.

Product Explorer in

R&D

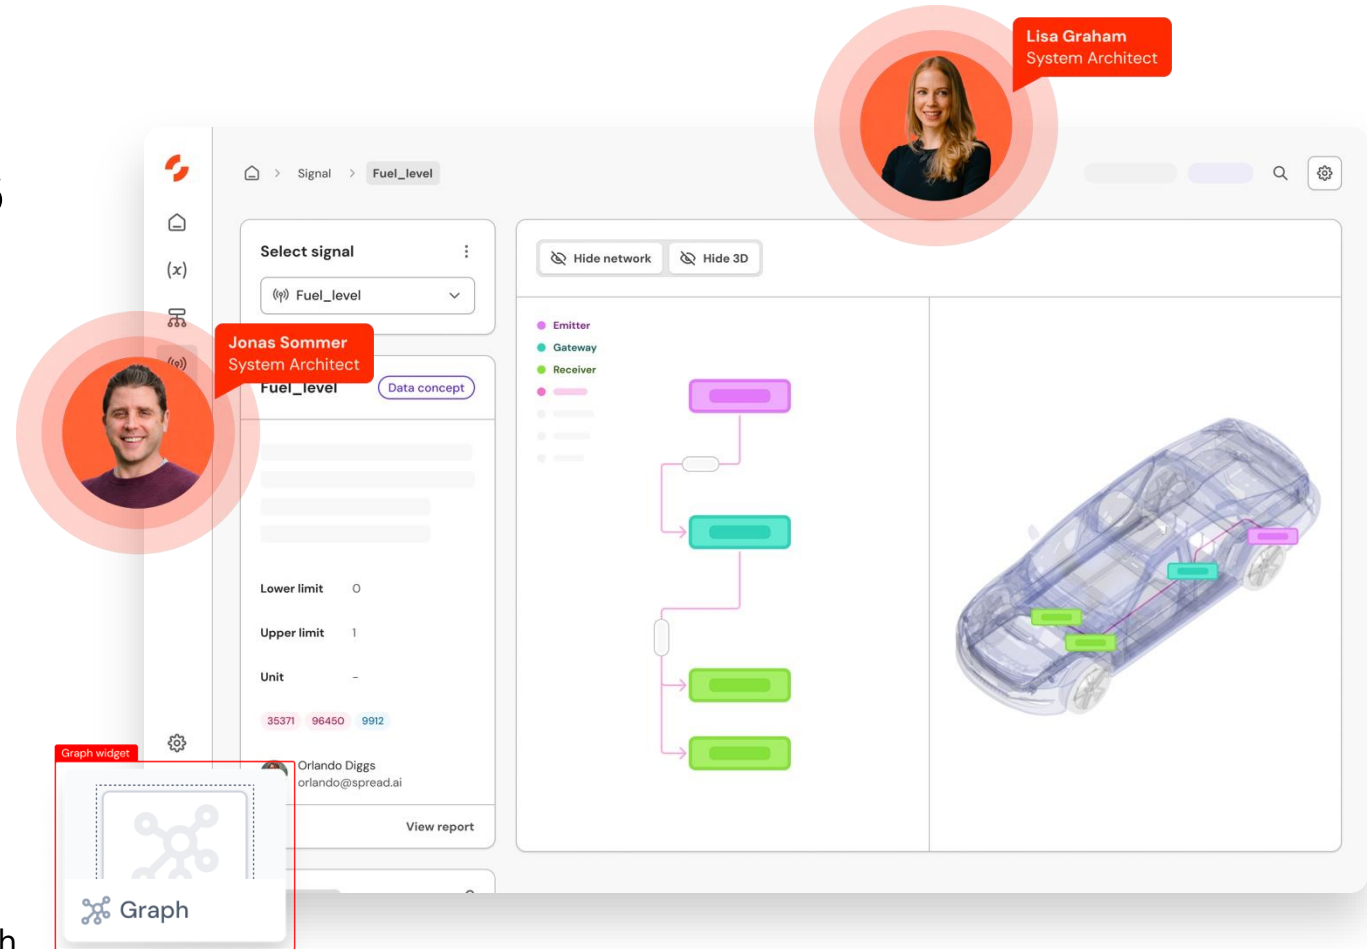

Navigate architectures to decode product complexity

Problem

Managing functional dependencies is crucial but often overlooked, leading to late-stage issues that are costly and time-consuming to resolve. Developers rely on complex tables that are hard to navigate, making it difficult to understand how components and functions interact. This lack of clarity increases errors, delays, and costs.

Solution

Your component responsible and function developers are equipped with an intuitive, graphical overview of functional dependencies. By offering clear insights into component, function, and signal relationships, developers can proactively address issues, ensuring earlier error detection and seamless integration. This enhances clarity, reduces rework, and accelerates the development process, enabling smoother collaboration across your R&D teams.

The screenshot displays the SPREAD Product Explorer interface. On the left, a sidebar shows a navigation menu with icons for home, close, and search. The main content area is titled 'Signal > Fuel_Level'. It features a 'Select signal' dropdown menu with 'Fuel_Level' selected. Below this, there are fields for 'Lower limit' (0), 'Upper limit' (1), and 'Unit' (-). A 'Data concept' button is visible. On the right, a legend identifies 'Emitter' (purple), 'Gateway' (teal), and 'Receiver' (green). A flow diagram shows a purple emitter connected to a teal gateway, which then connects to two green receivers. To the right of the flow diagram is a 3D model of a car with colored callouts corresponding to the components in the flow diagram. Three circular callouts with red borders highlight team members: Jonas Sommer (System Architect) near the signal selection, Lisa Graham (System Architect) near the top right, and Orlando Diggs (orlando@spread.ai) near the bottom left. A 'Graph widget' tooltip is shown at the bottom left, containing a graph icon and the text 'Graph'.

R&D

Explore signals and functions

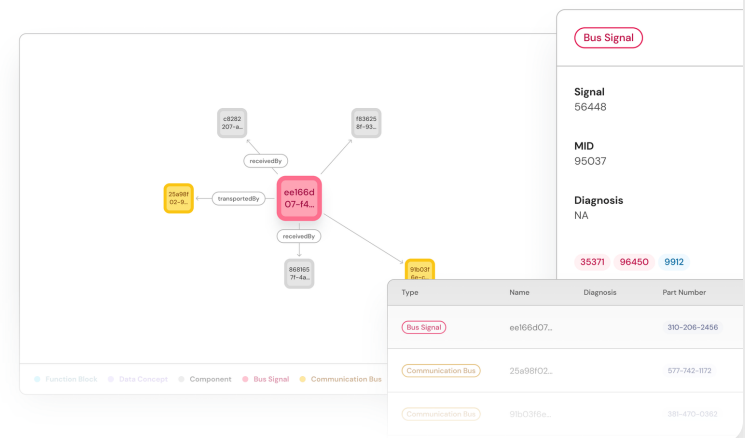

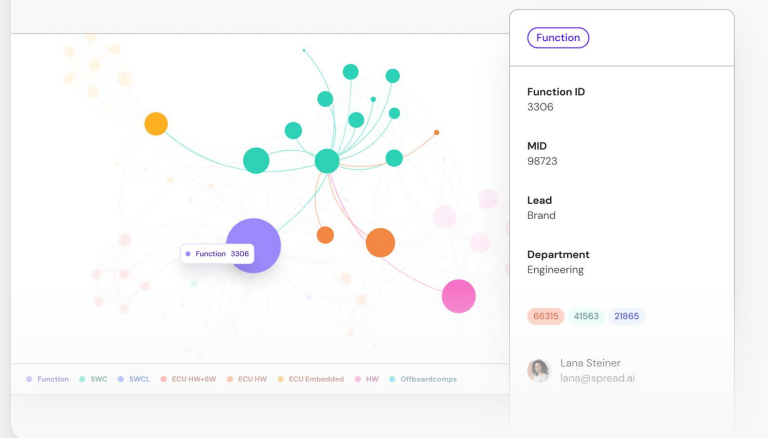

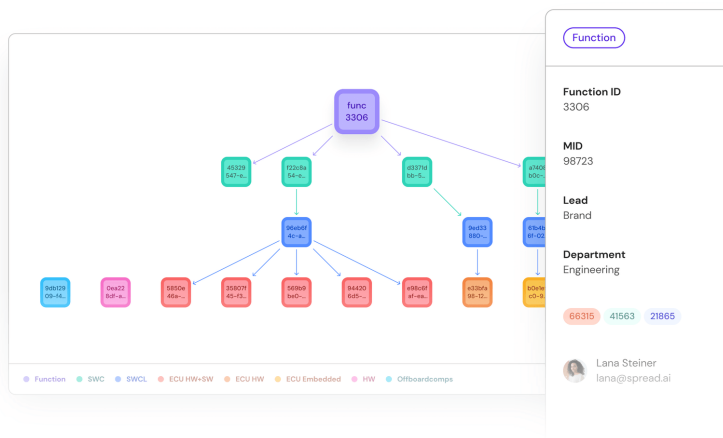

Investigate existing signals and their roles within a system functions. Gain a clear understanding of communication flows and functional interactions to support design validation and optimization.

Analyze component mapping

Examine how functions are distributed across components, ECUs, and their associated software modules. Identify dependencies and assess how these mappings impact system performance and reliability.

Break down functions into signals

Understand which signals ultimately constitute a function. Examine sender-receiver views of all signals and gain an overview of your system's communication network.

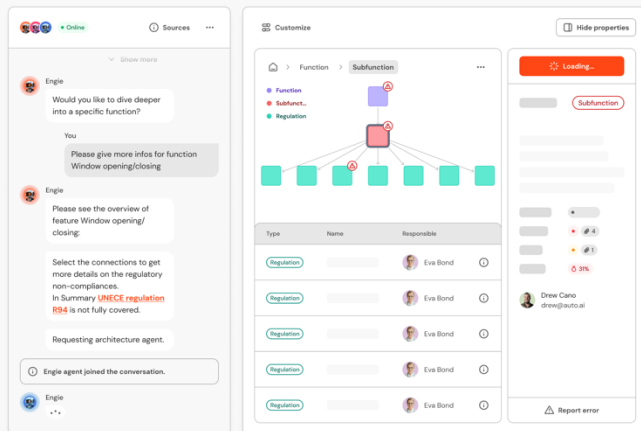

Product Explorer in

R&D

Use Case Requirement Management

Align Requirement Management

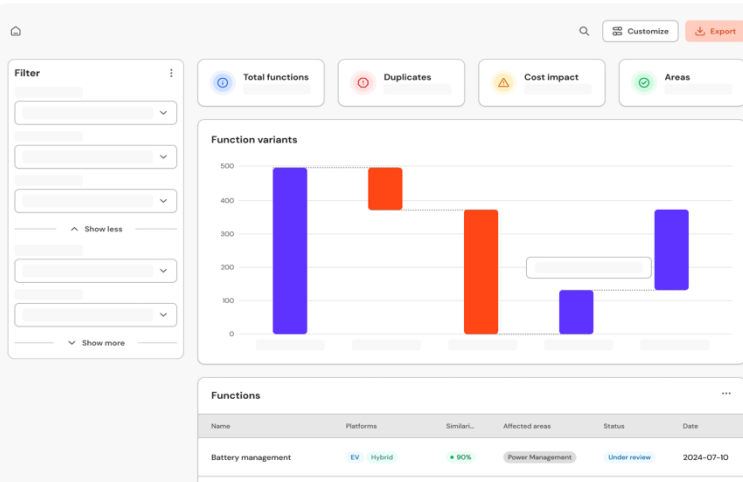

Simplify requirement management with centralized access to specifications, traceability links, and status updates. Align teams, track changes efficiently, and ensure compliance with project goals, enabling faster validation and smoother development workflows.

Use Case Variant Management

Manage Variant & Configuration

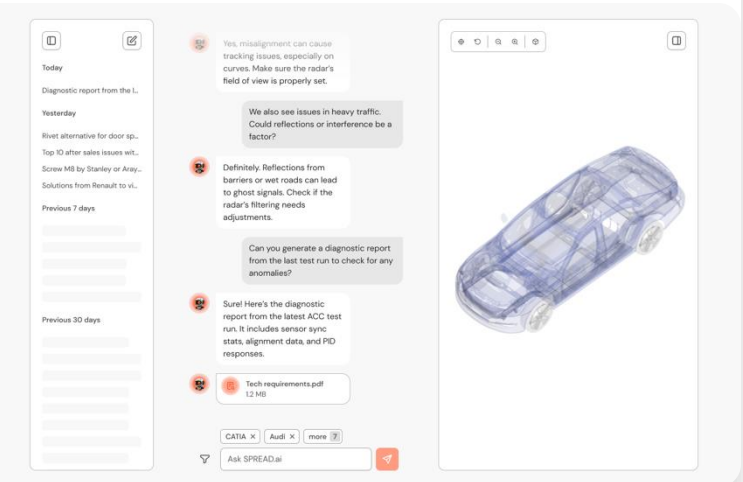

Easily manage variants and configurations with centralized access to technical data, dependencies, and change histories. Optimize decision-making, ensure consistency across teams, and streamline the integration of complex product configurations.

Use Case Knowledge Assist

Unleash knowledge within your R&D

Integrate fragmented data sources and structure unstructured information for seamless access. Enable efficient searches for compliance, portfolio management, and other critical inquiries, ensuring your team stays aligned and informed across all project stages.

Product Architect in R&D

Design architectures with system dependencies in mind

Problem

Complex system architectures require clear insights into dependencies across hardware and software. Variants, models, and evolving functions add to this complexity, making it hard to align and optimize designs efficiently.

Solution

Your R&D teams can define and refine requirements, realize functions, and design components while managing dependencies across variants. With system-level insights and intuitive search, create functions, and components faster, ensuring optimized system architectures and seamless collaboration.

The screenshot displays the SPREAD software interface. On the left, a sidebar shows a 'Graph widget' icon. The main area is titled 'Signal > Fuel_Level'. It features a 'Select signal' dropdown menu with 'Fuel_Level' selected. Below this, there's a 'Fuel_level' section with a 'Data concept' button and a list of parameters: 'Lower limit' (0), 'Upper limit' (1), and 'Unit' (-). A 'View report' button is at the bottom. On the right, a 'Signal network' diagram is shown with a legend for 'Emitter' (purple), 'Gateway' (teal), and 'Receiver' (green). The diagram shows a flow from a purple emitter through a teal gateway to two green receivers. A search bar at the top right has 'Hide network' and 'Show 3D' options. Two user avatars are overlaid: Lisa Graham, System Architect, in the top right and Jonas Sommer, System Architect, in the bottom left.

Product Architect in

R&D

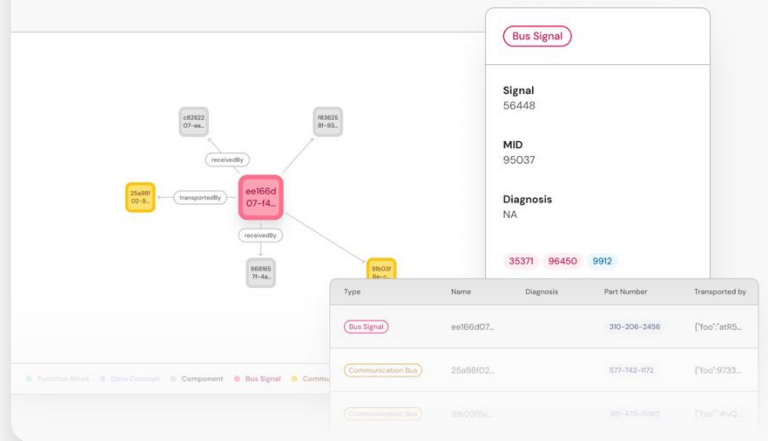

Create signals and functions

Define and create signals and functions to represent system behaviors and interactions, forming the foundation of your system architecture.

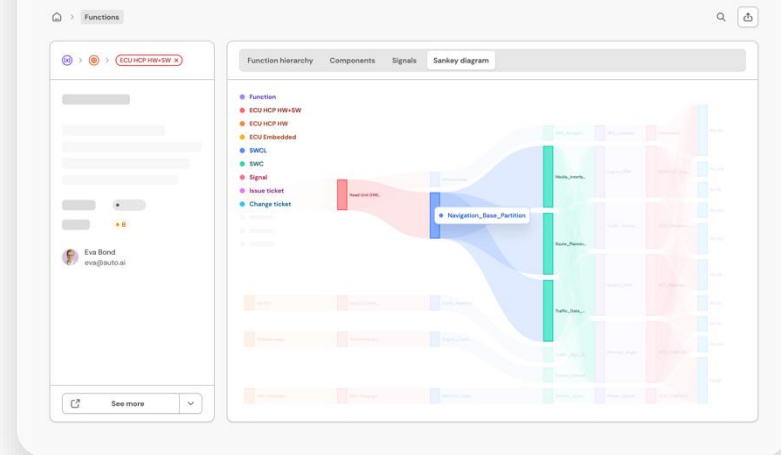

Assign functions to components

Map functions to specific components, ECUs, and their associated software modules, ensuring a clear definition of how the system is realized.

Understand system relations

Visualize and establish precise relationships between signals, functions, components, and software modules, creating a fully traceable and structured system network.

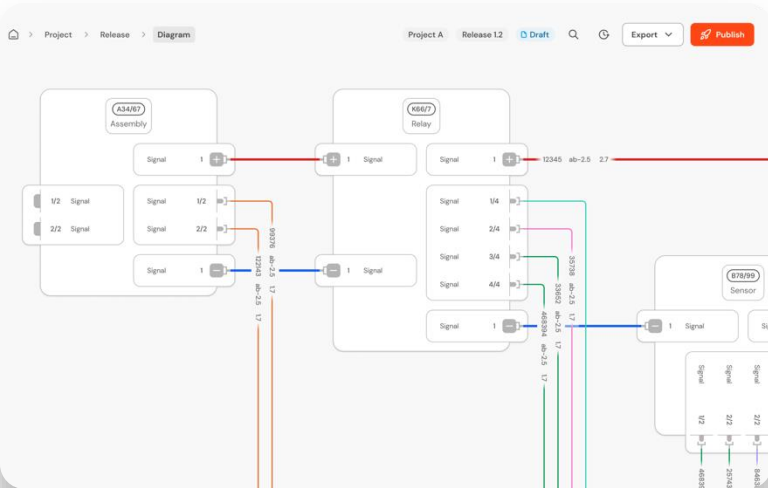

Product Architect in

R&D

Use Case Wiring Design

Accelerate wiring harness design

Circuit Diagram Creator (CDC) simplifies the creation and management of circuit diagrams with its versatile object library. Define components, connect them, and export diagrams to E-CAD tools for seamless early-stage development.

Use Case Wiring Optimize

Optimize wiring harness

Cross-Section Optimization (CSO) enables efficient evaluation of wiring harnesses by analyzing data against standards. Upload harness files, electrical specifications, and run automated checks for voltage drops, fuse ratings, and compliance, ensuring optimized and accurate designs quickly.

 R&D

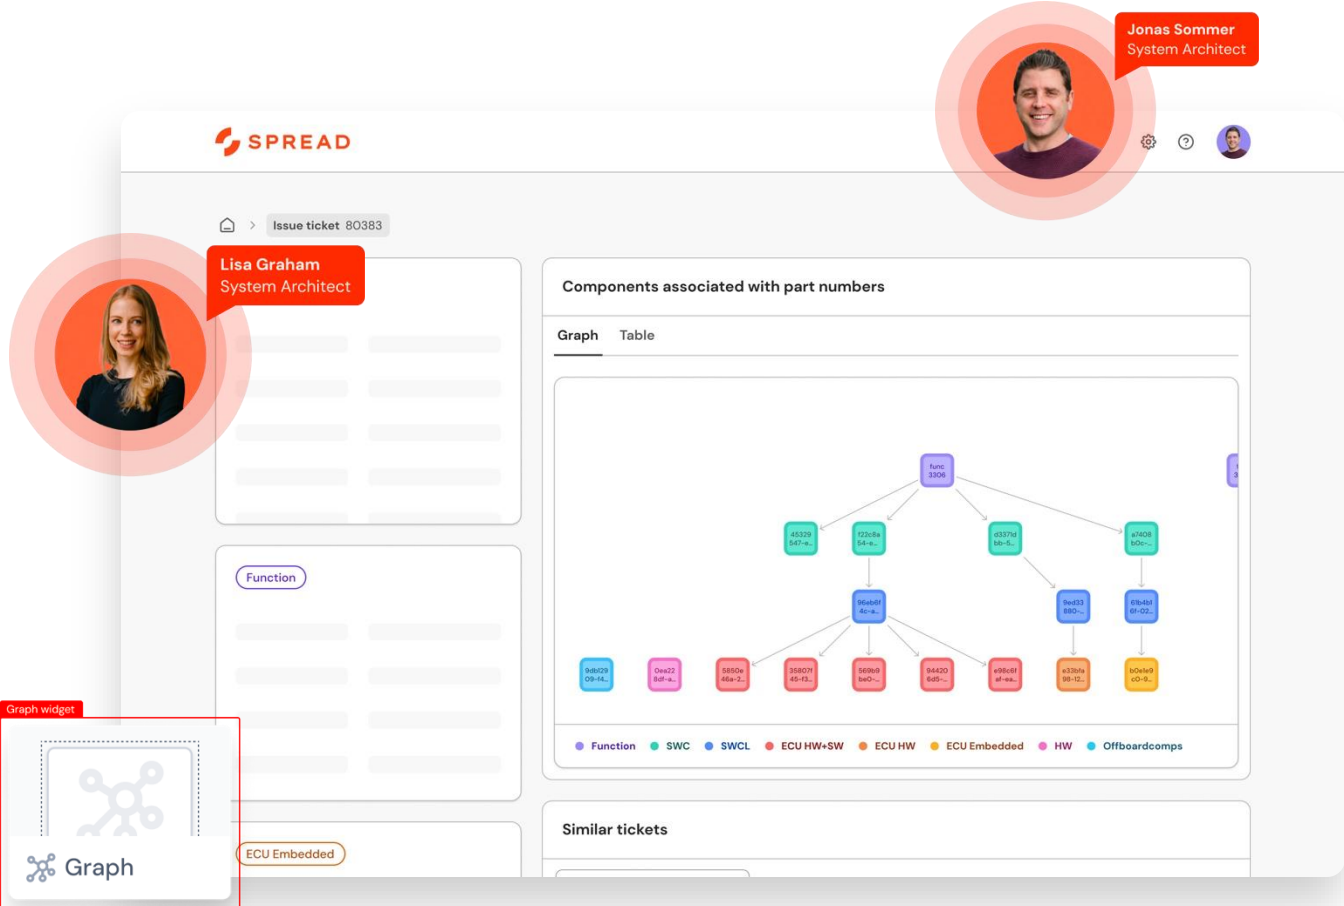

Detect issues early with complete traceability

Problem

R&D teams are under increasing pressure to resolve errors quickly as SOP deadlines loom. Disconnected systems and limited traceability complicate diagnostics and impact chain analysis, slowing down resolution. Without a clear understanding of how tickets connect to components, functions, and signals, these inefficiencies result in higher costs, delayed timelines, and risks to product readiness, ultimately hampering innovation.

Solution

The E/E Inspector solution enables your teams to efficiently identify errors and recurring patterns by connecting tickets to system dependencies such as components, functions, and signals. Enhanced traceability and transparency facilitate faster issue resolution, reduced delays, and improved collaboration, ensuring readiness for testing and production while driving innovation.

The screenshot displays the SPREAD E/E Inspector interface. At the top right, a user profile for Jonas Sommer, System Architect, is visible. The main content area shows an issue ticket (80383) with a 'Function' tab selected. A 'Graph widget' is highlighted, showing a hierarchical tree diagram of components associated with part numbers. The graph starts with 'func 3204' at the top, branching into several intermediate nodes like 'a6328 547-a...' and 'f2584 56-a...', which further branch into leaf nodes such as '98829 09-H...', '04422 68-a...', '33504 46a-2...', '33823 25-F3...', '98869 64c-...', '84423 645-...', 'e16048 e1-ae...', '82364 68-12...', and '90449 c0-2...'. A legend at the bottom of the graph identifies the nodes by color: Function (purple), SWC (green), SWCL (blue), ECU HW+SW (red), ECU HW (orange), ECU Embedded (yellow), HW (pink), and Offboardcomps (cyan). Below the graph, there is a 'Similar tickets' section.

R&D

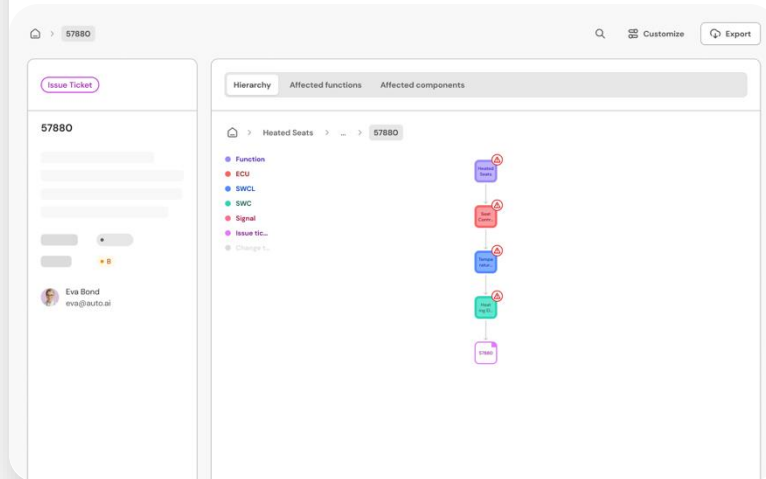

Explore issue tickets centrally

Link issue tickets to part numbers, functions, and release details in one view. Quickly identify dependencies and root causes while eliminating manual searches, enabling faster and more accurate diagnostics.

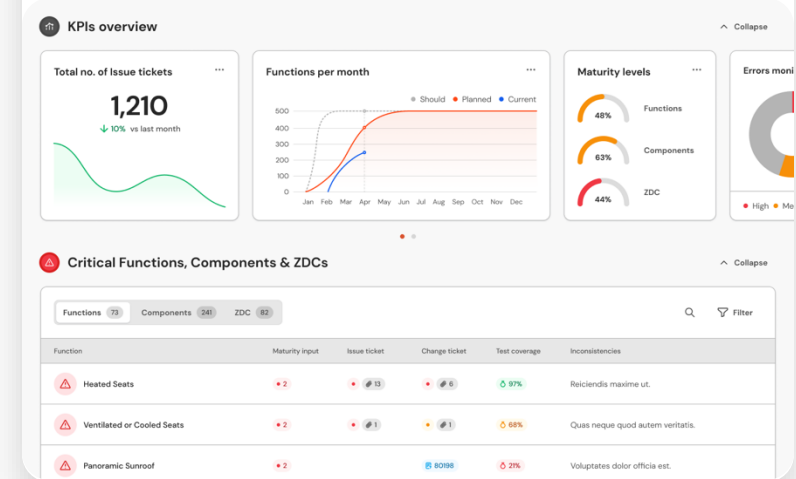

Dependency and root cause insights

Map components, functions, and dependencies to trace malfunctions. Visualize interconnections with color-coded insights to quickly isolate and resolve root causes, even in complex systems.

Track KPIs for error-free integrations

Use a dashboard to track resolved vs. unresolved tickets and diagnostic insights. Streamline troubleshooting with clear KPIs, eliminating duplicates and recurring errors efficiently.

⚠️ E/E Inspector in

 R&D

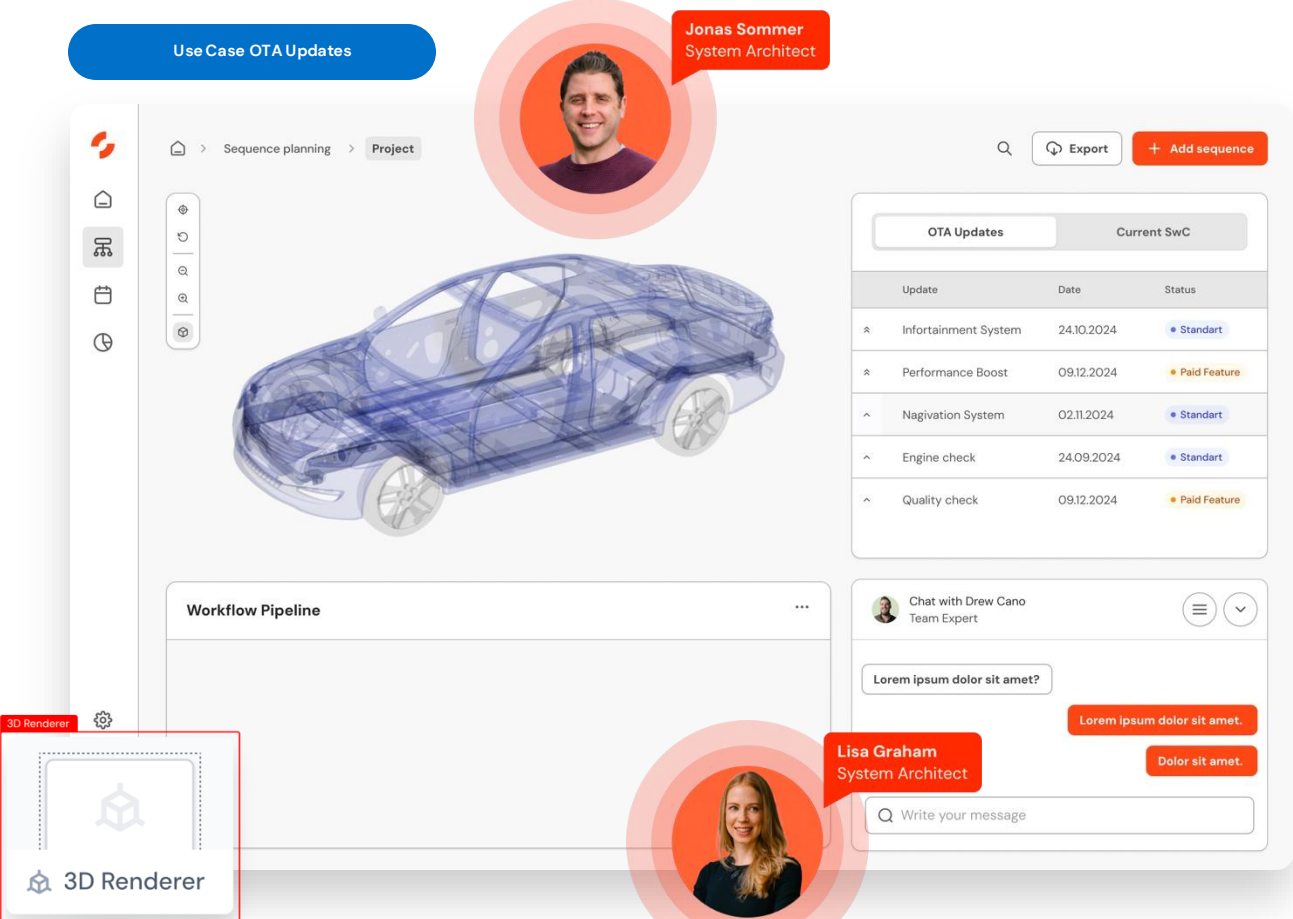

Boost OTA Update efficiency from Development to vehicle integration

Problem

Managing and enabling over-the-air (OTA) Updates involve challenges in both R&D and deployment. Errors in the update process can affect the vehicle performance and customer satisfaction. Inefficiencies in update delivery leads to delays, impacts functionality, and raises support costs. These challenges result in lost trust and potential revenue loss due to decreased customer satisfaction and increased maintenance needs.

Solution

Your team can leverage our OTA update management system to streamline the process from R&D to deployment. By ensuring efficient analysis, thorough testing, and reliable updates-delivery, our system maintains optimal vehicle performance and enhances customer satisfaction through timely and accurate updates.

The screenshot displays the SPREAD software interface for managing OTA updates. At the top, a blue header reads "Use Case OTA Updates". Below this, a navigation bar shows "Sequence planning" and "Project". A central 3D wireframe model of a car is shown. To the right, a table titled "OTA Updates" lists various update items with their dates and statuses. Below the car model, a "Workflow Pipeline" section is visible. On the right side, a chat window titled "Chat with Drew Cano" is open, showing a message input field and a "Write your message" button. A "3D Renderer" window is also visible at the bottom left.

Update	Date	Status

📡 Action Tower in

R&D

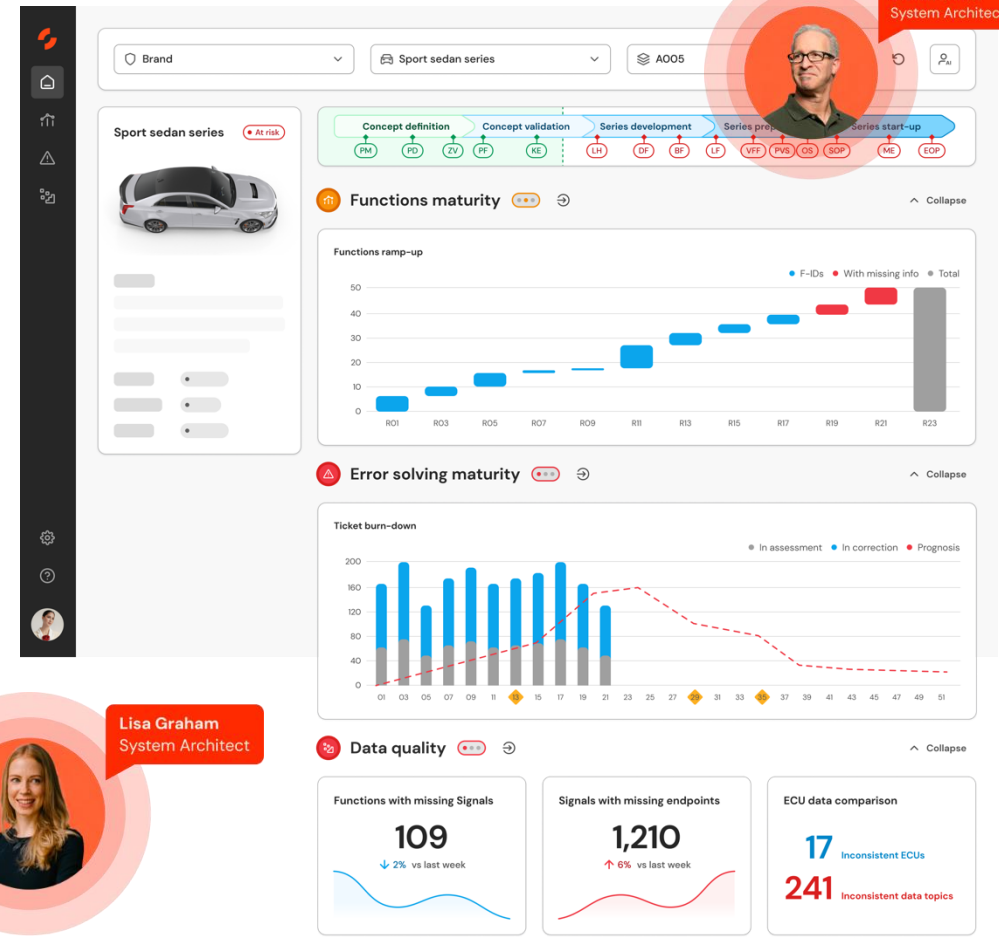

Steer R&D with product maturity, error insights, and data governance

Problem

R&D leaders, series managers, and product line managers struggle with fragmented insights into development progress, error resolution, and data completeness. Disconnected systems and manual tracking across multiple platforms and spreadsheets create blind spots in maturity, error management, and data consistency - resulting in delays, inefficiencies, and reliance on intuition rather than data-driven decisions.

Solution

You and your team benefit from real-time dashboards providing insights into product maturity readiness, unsolved errors, and data quality. Based on your questions, you can dive into specific errors, assess their impact on function readiness, and take data governance actions where needed. By replacing manual reporting with structured, fact-based insights, SPREAD enables you to focus resources on critical issues, keep development on track, and reduce rework efforts.

Up to **40%**
SOP delays reduction

Up to **30%**
development cost reduction

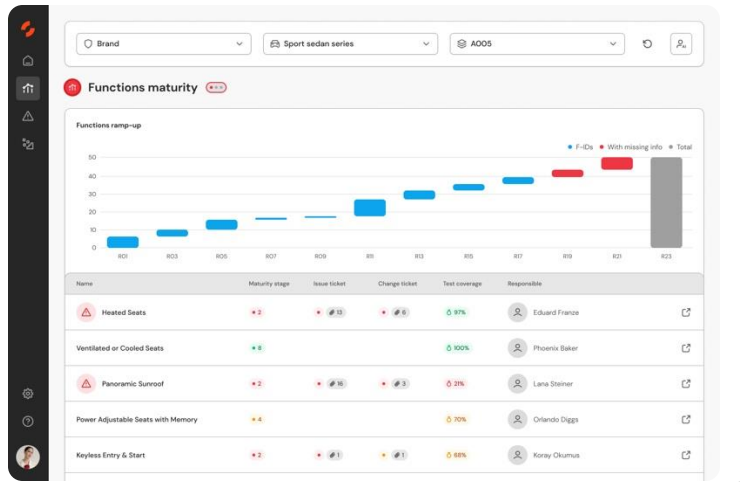

Up to **25%**
increased on-time milestone completion

📡 Action Tower in

R&D

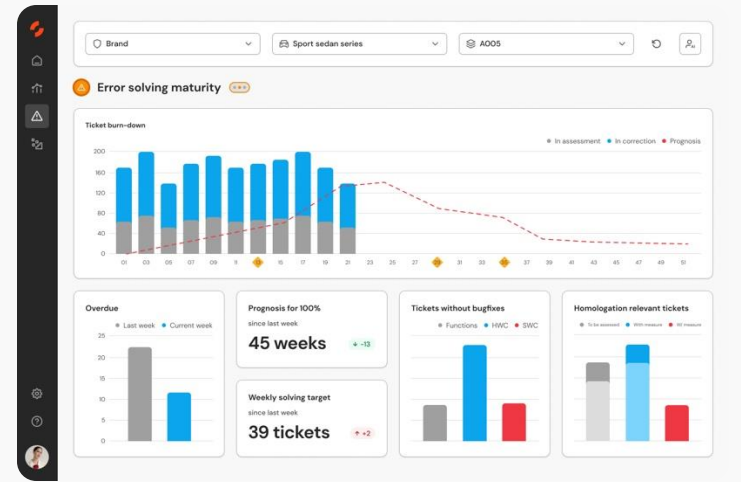

Monitor product maturity in real-time

Monitor status on product maturity, showing current state and planned functional ramp-ups, releases, and SW & HW component readiness. This enables actionable decision-making and prioritization, as well as detailed deep-dives where needed, all supported by connecting system data to ensure nothing is overlooked.

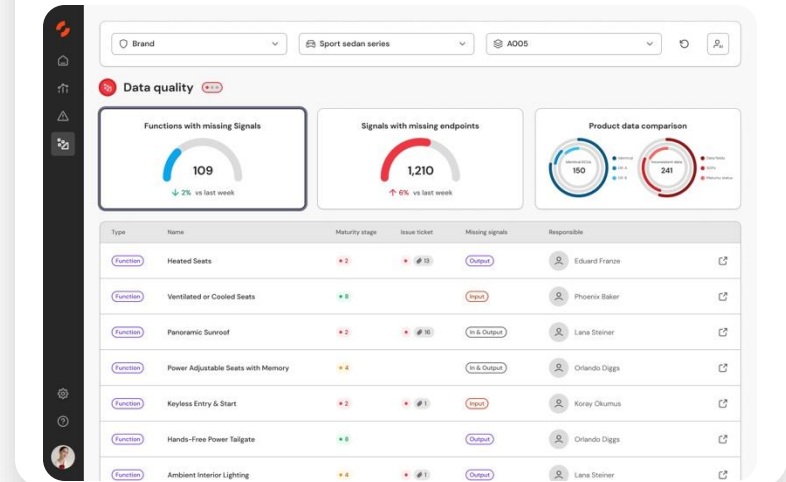

Easily keep track on errors

Automatically generate and unify error and issue status into a comprehensive report. Track historic trends, planned vs. actual issues predictions, and critical KPIs, while highlighting the most severe and long-lasting issues. By linking errors to product maturity, you can assess risks and derive effective mitigations.

Ensure data quality and governance

Assess the quality of data critical for steering your project from an architecture perspective, focusing on completeness, and consistency. Easily identify gaps that slow down engineering processes. Take action by engaging the responsible teams or departments to ensure strong data governance and project efficiency.

Action Tower in

R&D

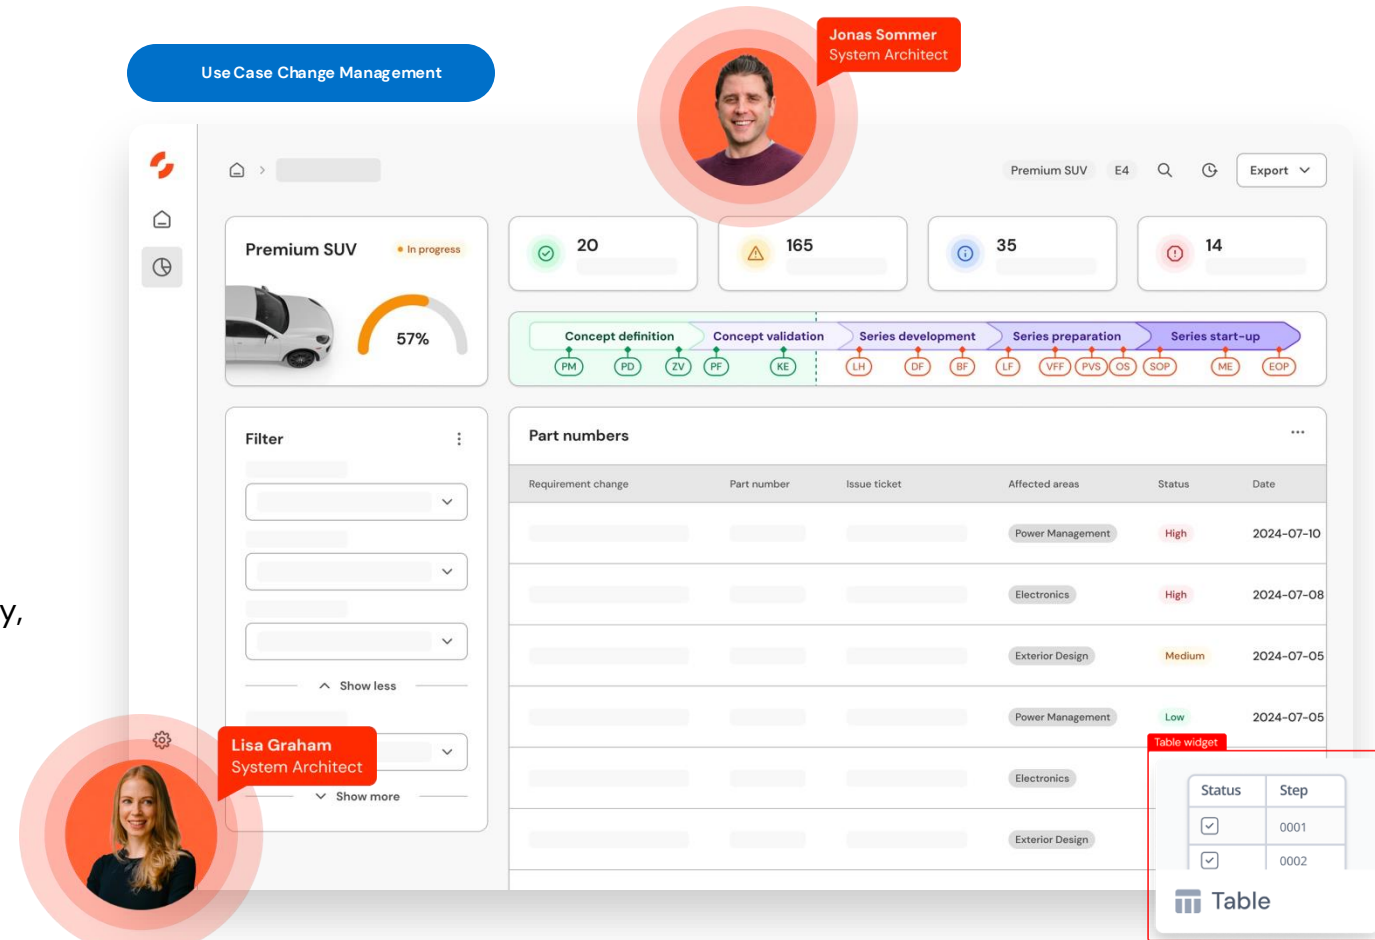

Trace the impact of changes on all dependencies

Problem

Throughout the entire R&D process, changes must be managed efficiently, whether they involve Model Year Updates (MOPF), Over-the-Air (OTA) updates, or Remote Software Updates (RSU). Error managers, BTVs, and FPVs need a clear overview of all change-related information and impact chains. Currently, tracking changes is inefficient, relying on change ticket numbers, part numbers, or functions.

Solution

Your team benefits from our streamlined change management solution, which integrates information from various sources and presents and prioritizes changes in a unified interface. By integrating impact chain data, you can quickly identify and resolve issues, ensuring efficient and productive R&D process.

 **Production**

Optimize assembly and error resolution to achieve higher first-pass yields

Problem

Misaligned product and production data, unresolved SW and E/E errors, and inefficient assembly planning hinder production efficiency. Production teams face difficulties troubleshooting errors, onboarding new employees, and optimizing processes during ramp-up phases, leading to delays, reduced throughput, and challenges in scaling ramp-ups and ensuring consistent production quality.

Solution

SPREAD enables greenfield production by optimizing assembly sequence planning, resolving SW and E/E errors faster and integrating product and production data. Your teams gain actionable insights to enhance throughput, reduce disruptions, and foster continuous improvement, ensuring smooth ramp-ups and production efficiency.

Product Architect in

Production

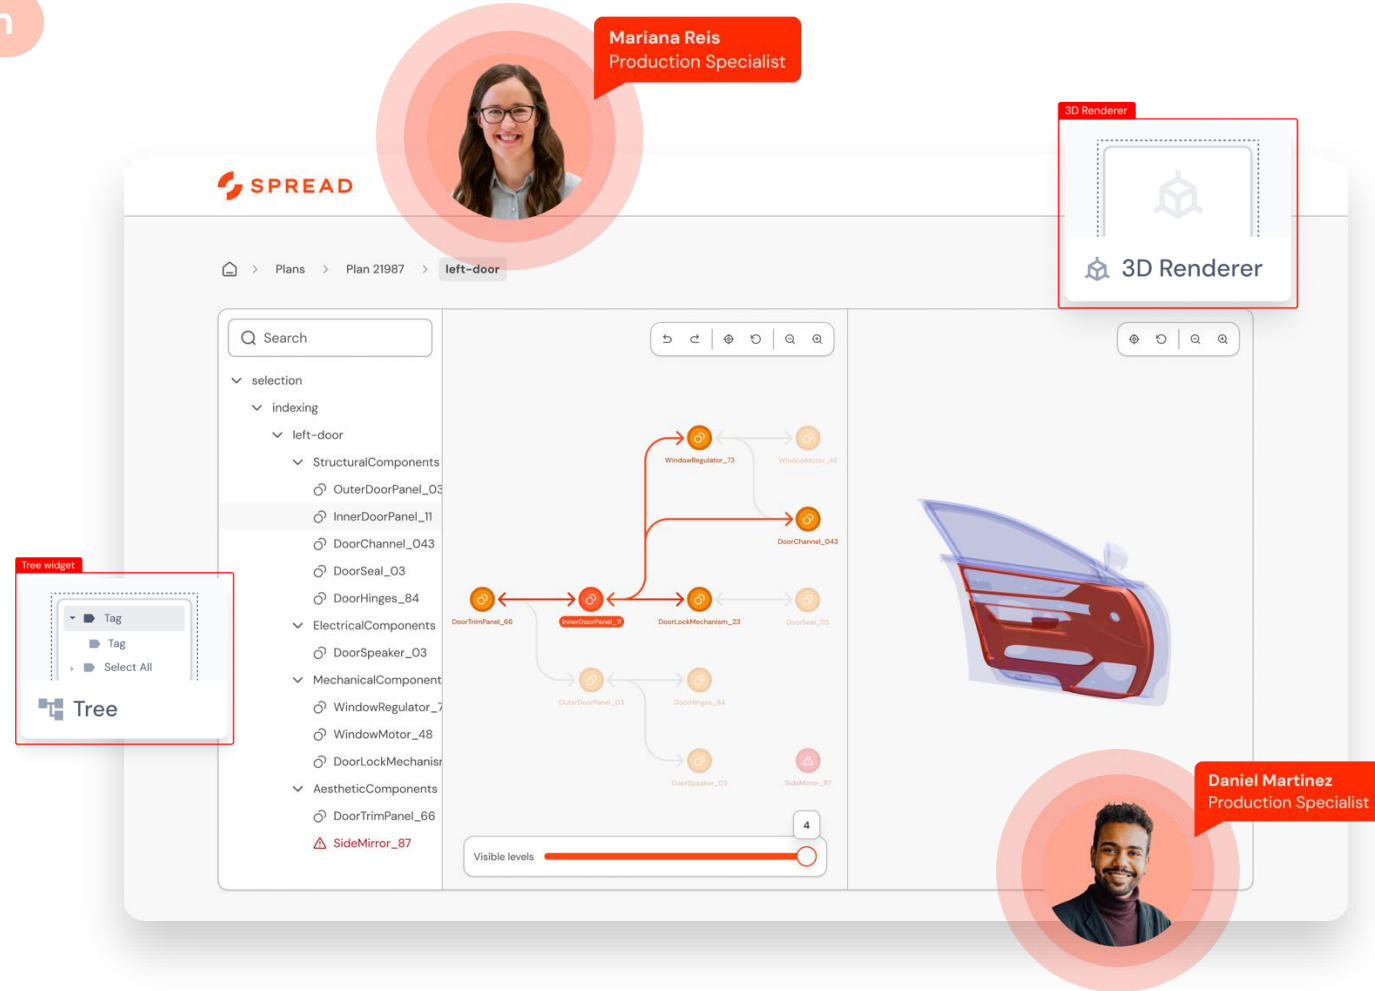

Design production-ready system architectures

Problem

In manufacturing, greenfield planning faces growing pressure to accelerate time-to-market, control costs, and integrate innovations. Current tools rely on manual mapping of assembly sequences from CAD and BOM data, making the process slow and error-prone. This creates challenges for Process Planners, Industrial Engineers, and Production Managers to deliver precise sequence planning for complex demands.

Solution

SPREAD Product Architect, powered by Assembly Assist, automates precedence graph creation by analyzing CAD geometries and integrating BOM data. Using AI, it generates optimized assembly sequences, revealing dependencies and aligning resources. Users can easily adjust nodes and sequences, ensuring efficient, precise, and flexible planning while reducing manual effort and supporting production goals.

Up to **80%** savings in sequence planning costs

More than **95%** correct assembly dependencies

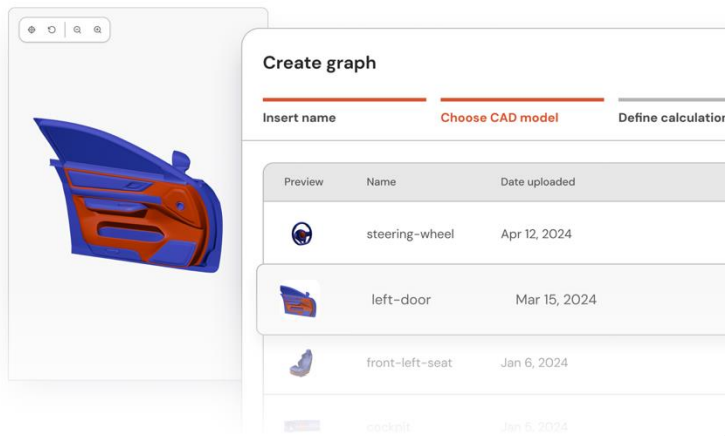

Up to **2x** more efficient production processes

Product Architect in

Production

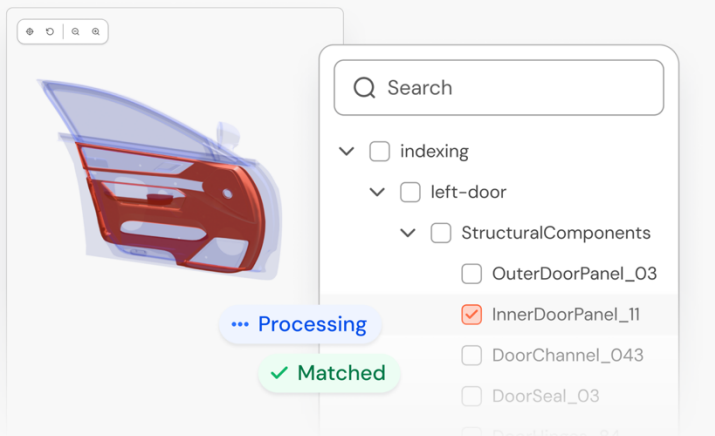

Import CAD Models and product data

The solution requires a CAD model as input, extracting product and BOM data from integrated systems or allowing users to define assembly groups. This forms the foundation for automated assembly planning.

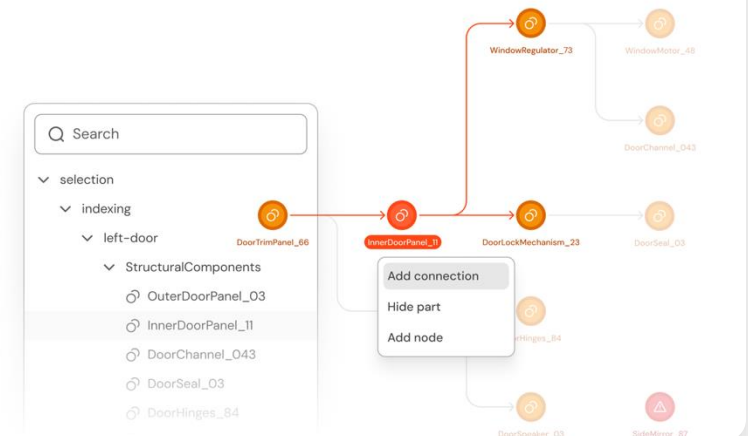

Generate optimized precedence graph

Provide the start node and any optional constraints, such as last parts or specific part orders. Our AI algorithm will handle the rest, calculating geometrically reasonable assembly dependencies by analyzing the 3D data.

Adapt precedence relations

In the web solution, you can validate the calculated precedence relations directly using the interactive 2D graph view, which is condensed to a view relevant for production. Dependencies can there be adapted if the algorithm missed any and view all parallel and sequential assembly steps.

⚠️ E/E Inspector in

⚙️ Production

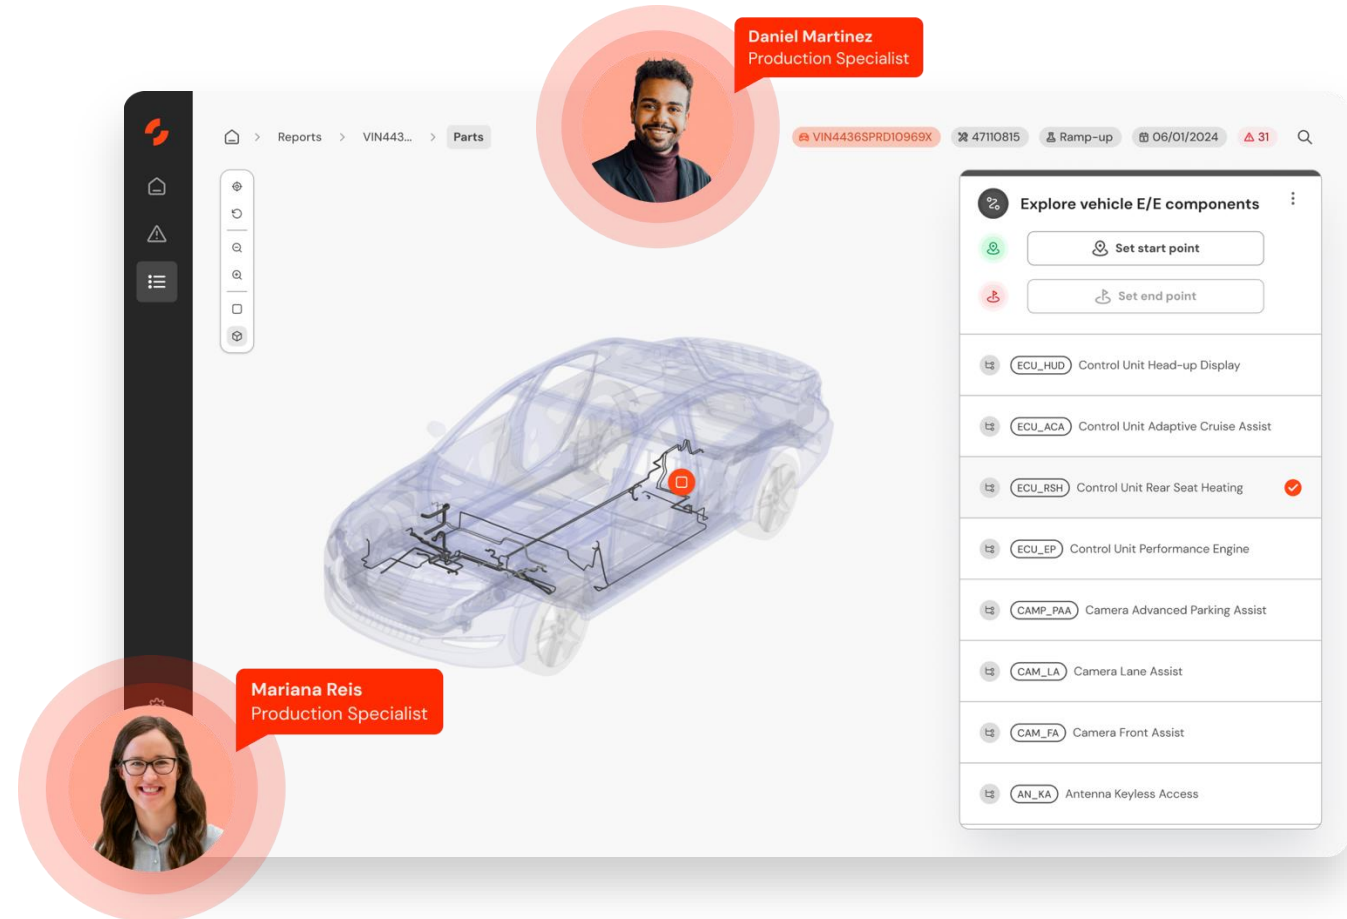

Guide troubleshooting for improved first-pass yields

Problem

Growing product complexity creates production challenges, making it harder to locate E/E components. Current solutions focus on physical connections but miss VIN-specific 3D views and logical paths, increasing reliance on expert knowledge. This slows fault resolution, delays production, and reduces first-pass yields (FPY), overloading rework stations and impacting workers, planners, and plant managers.

Solution

The E/E Inspector provides VIN-level visualizations, reducing reliance on expert knowledge and manual searches. It analyzes logical paths, suggests error causes, and filters data by configuration. By combining diagnostics, signal mapping, and component data in one 3D view, it enables faster E/E issue resolution, reducing rework and improving FPY.

Up to
30%

increase in first-pass yield

Up to
75%

reduced process steps

Up to
70%

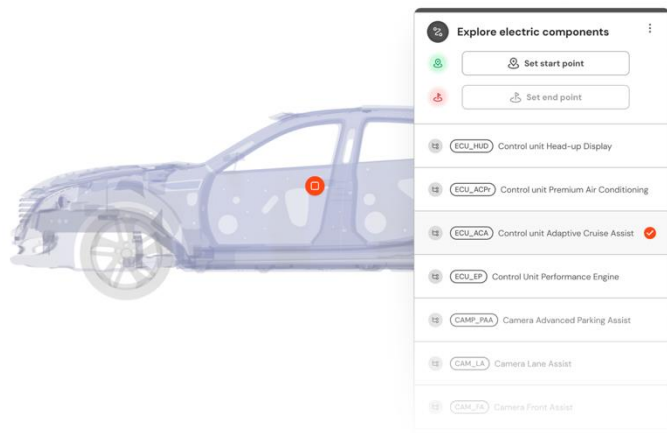

reduced error searching time

⚠ E/E Inspector in

⚙ Production

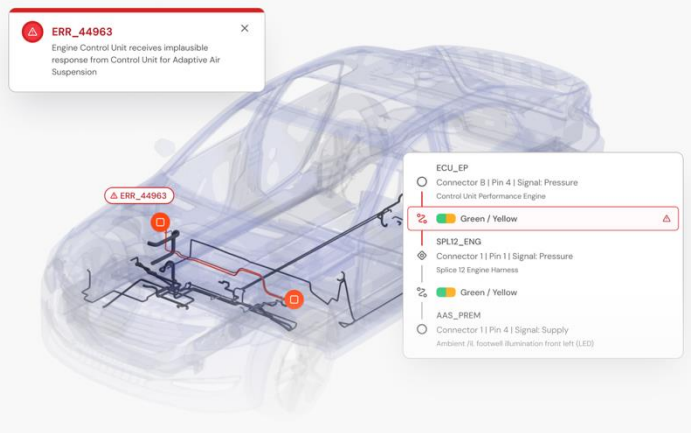

View signal path at VIN-level

Your product teams (inline or offline) can search for electric components in 3D, find communication partners and locate signal paths at a VIN-specific level. Instead of the 150% model covering all possible variants, we ensure that only components that are installed are displayed.

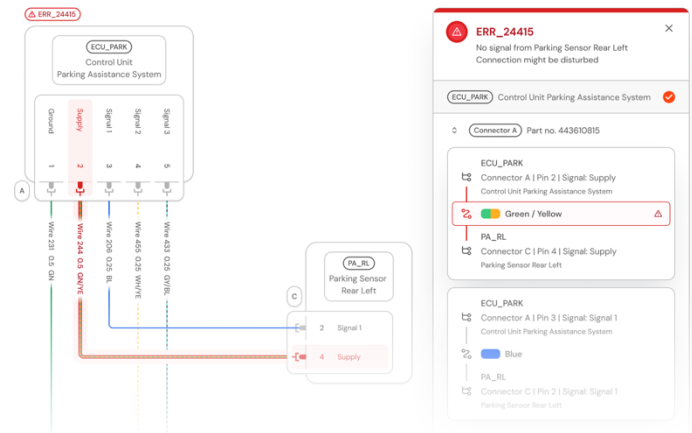

Identify faults with 3D error view

The solution swiftly guides users from error codes to error sources. The intuitive 3D visualization of the affected component, and the error causes suggestions make it easier to identify the source of the error.

Troubleshoot with wiring diagrams

The affected components can be further examined using the 2D circuit diagram. View communication paths, allowing to troubleshoot faulty control units, fuses, grounds, switches, or other (electrical) components.

Action Tower in Production

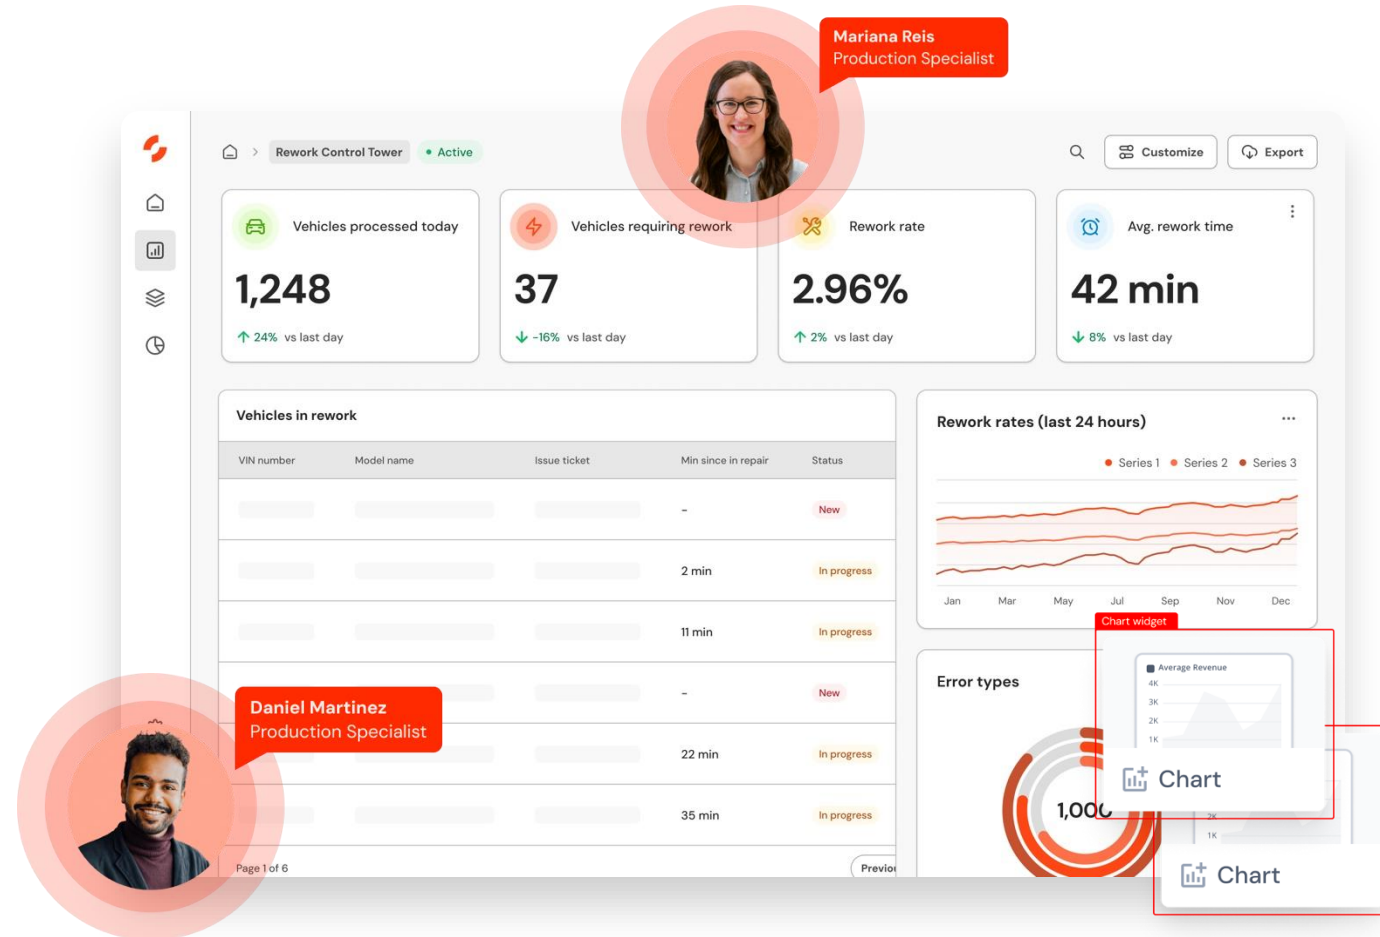

Sync production data for full operational visibility

Problem

Production supervisors and plant managers often lack a connected view of production line and product data, making it difficult to identify and resolve errors in real-time. Disconnected tools and manual tracking lead to slow responses, inefficiencies, and missed opportunities to optimize throughput, quality, and error resolution. These gaps increase downtime and hinder the achievement of production goals.

Solution

Your production supervisors and plant managers gain full control over throughput, quality, and error resolution with real-time dashboards. These tools sync production line data with product data to identify root causes, resolve bottlenecks faster, and minimize downtime. By ensuring clear visibility and seamless workflows, the solution helps achieve critical production KPIs with precision and efficiency.

Up to
15%
reduction in
downtime

Up to
10%

rework

📡 Action Tower in

⚙️ Production

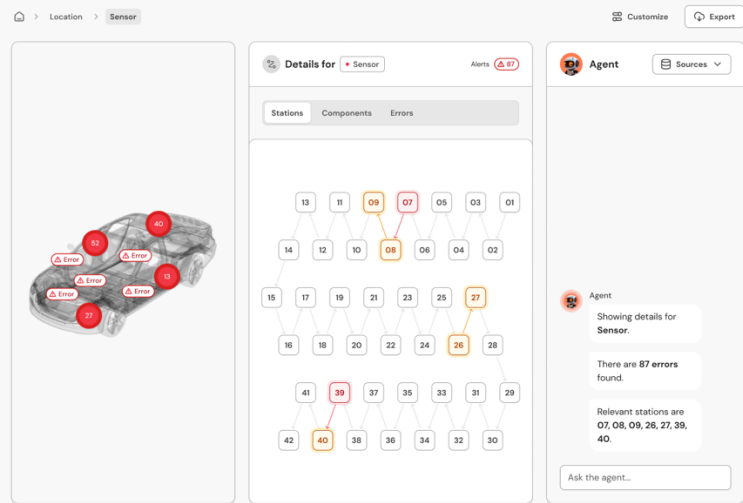

Achieve global plants steering

Track real-time performance across global plant locations with the Active Plants Map. Prioritize actions based on error severity to optimize production efficiency, reduce downtime, and focus on high-impact areas.

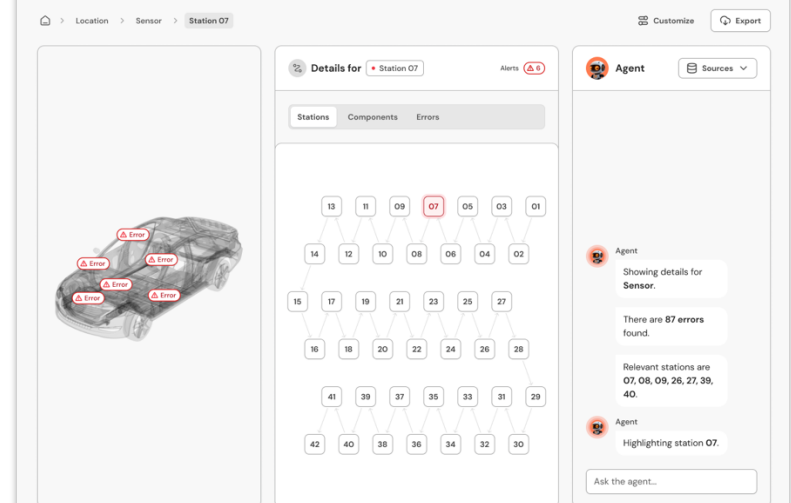

Enable sensor-level error analysis

Analyze errors at the sensor level, identifying specific issues affecting sensors or components. Gain deep insights into individual parts, enabling focused error resolution and maintaining continuous, smooth production flow.

Monitor station-level performance

Drill down into station-level data to pinpoint performance issues. Monitor critical stations for real-time error detection, prioritizing fixes that directly impact overall production speed, quality, and efficiency.

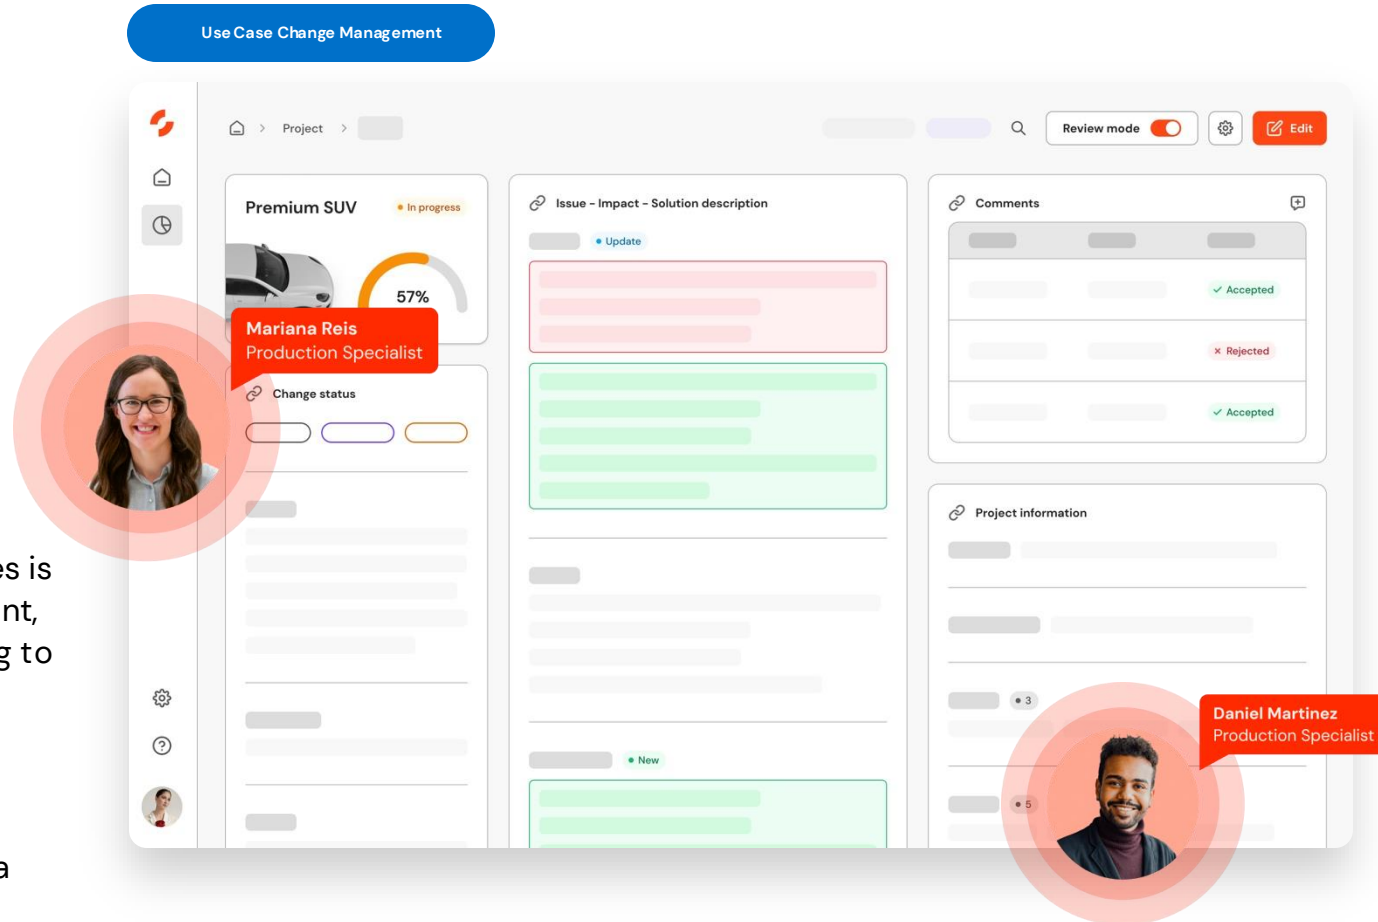

Tracing implications from changes to all dependencies

Problem

In Production, tracing the implications of changes across all dependencies is essential for maintaining efficiency. Without effective change management, understanding the full impact of modifications can be challenging, leading to increased errors and delays.

Solution

Provide your teams with end-to-end traceability of changes by offering a comprehensive view of how modifications impact all dependencies. By integrating information from various sources, the system displays and prioritizes changes effectively.

Up to **10x**
faster evaluation

Up to **50%**
reduced unforeseen changes

Up to **70%**
less time spend on alignments

Upskilling Coach in Production

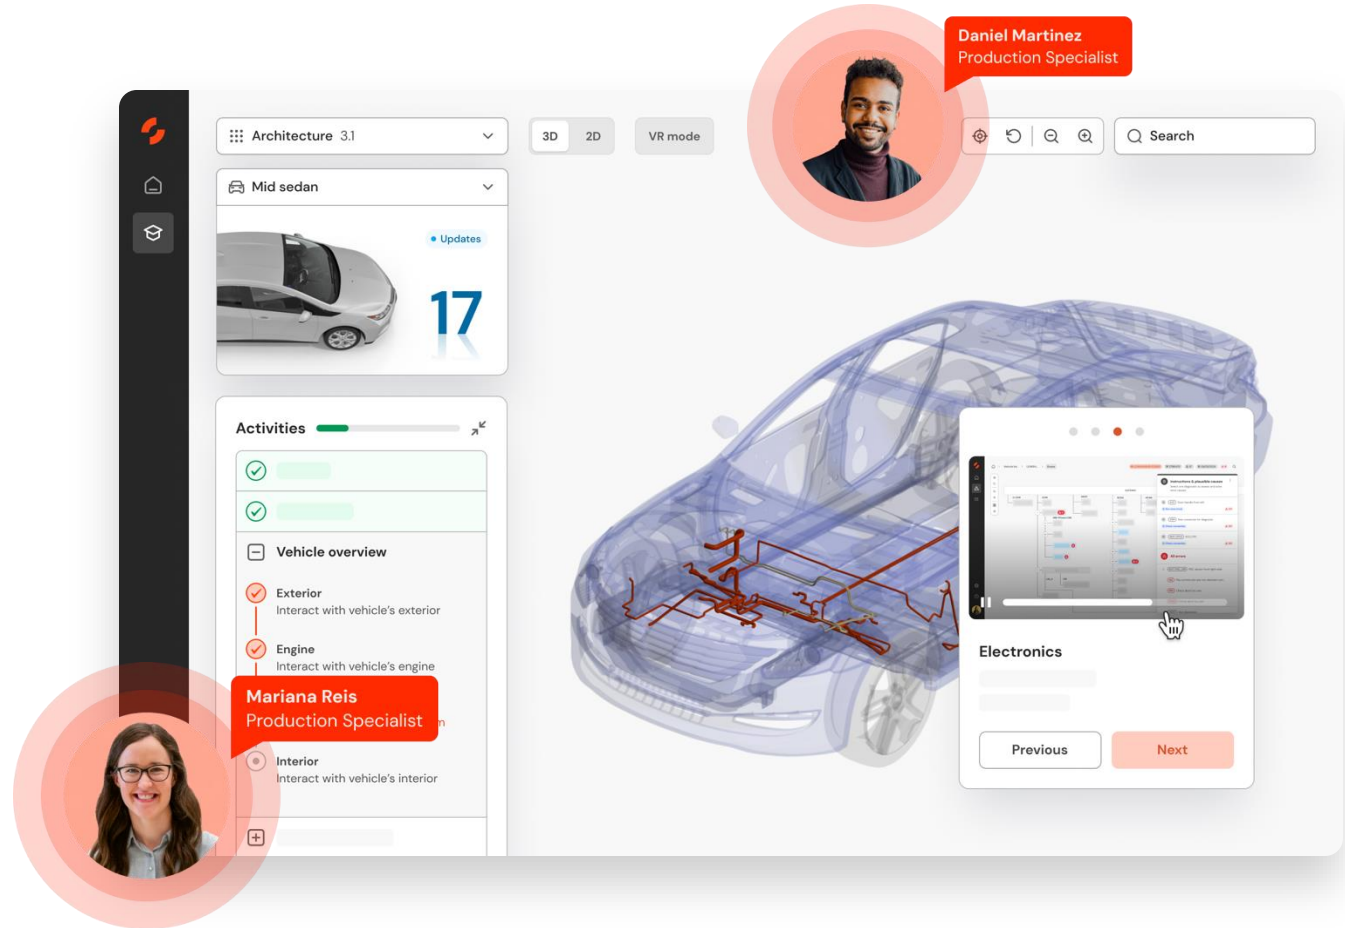

Provide live product knowledge and guidance

Problem

When setting up a new plant or running operations, production line workers face steep learning curves. Outdated manuals or inconsistent training lead to productivity loss, longer ramp-up times, and increased error rates. Additionally, the lack of live access to product information, variant deltas, and tailored learning paths makes it harder to adapt quickly. Training costs can escalate, with expenses from seminars and hardware qualifications reaching up to €120k per vehicle.

Solution

Your team can use our knowledge solution to integrate real-time training materials, live access to product information, and dynamic variant updates directly into their workflow. This enables on-the-job upskilling, improves understanding of complex components, reduces errors, and shortens ramp-up times. By replacing seminars and expensive hardware qualifications with virtual or hybrid training, costs are significantly reduced while ensuring streamlined workflows and continuous learning.

Up to **30%** reduction of ramp-up time

More than **50%** saved on training costs

 **Aftermarket**

Reduce warranty costs & recalls by empowering workers with end-to-end product data

Problem

Maintaining a product's functionality throughout its lifecycle affects customer satisfaction and operational efficiency. Limited transparency, especially for E/E and software components, complicates aftermarket product management. Service engineers and technicians often struggle to resolve SW and E/E issues due to a lack of system dependency insights and recurring error patterns. This leads to higher warranty costs, recalls, and customer dissatisfaction.

Solution

Empower your aftermarket teams with advanced solutions that provide transparency into product and variant data, especially for E/E and software components. Enable efficient fault diagnosis and repair, field quality monitoring, vehicle variant management, and optimized repair sequences, reducing warranty costs and minimizing recalls.

Product Explorer in

Aftermarket

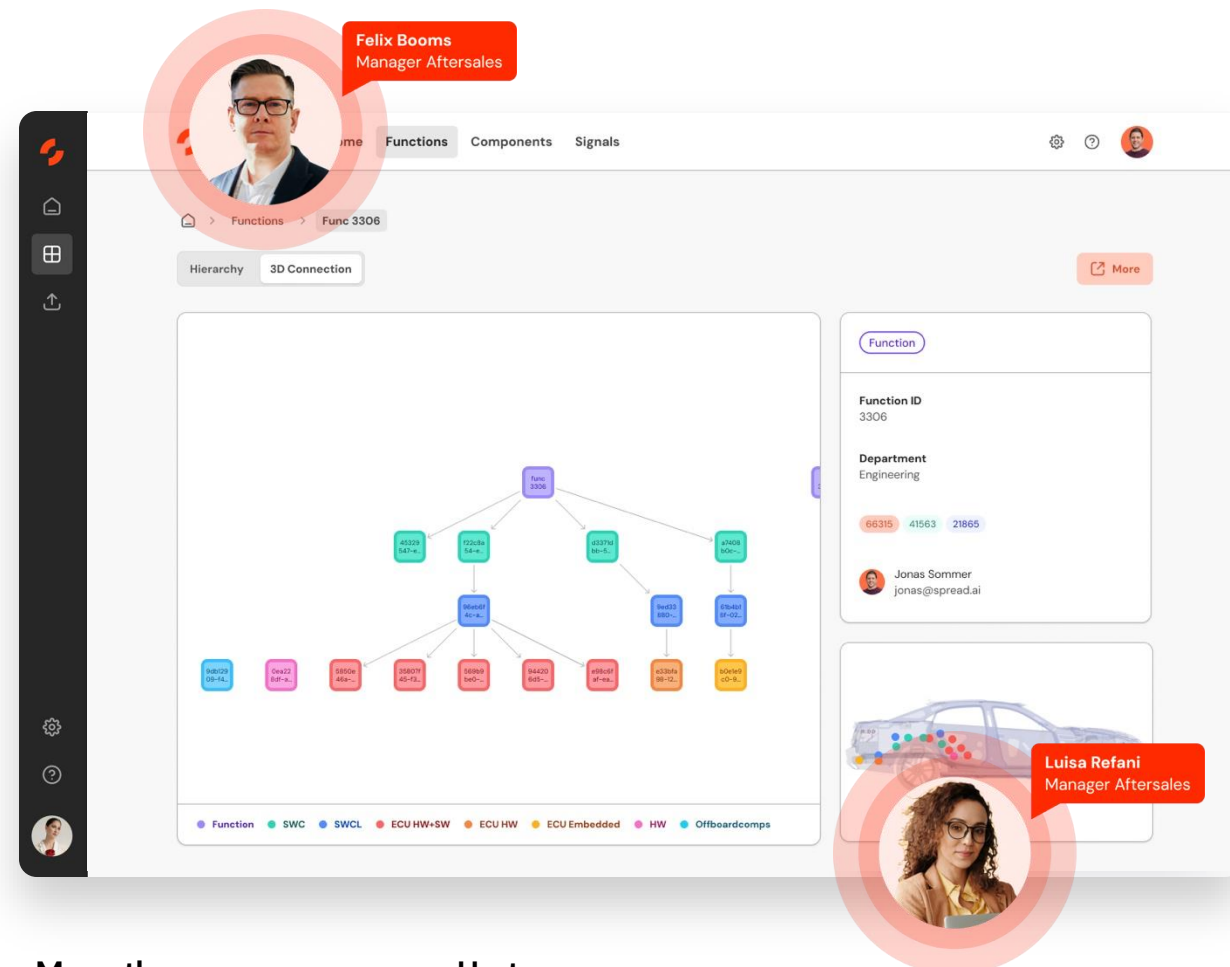

Provide transparency for aftermarket product management

Problem

Aftersales teams lack clear data on vehicles and components throughout their lifecycle. Questions about a vehicle's location, production details, installed parts, or recent upgrades are often unanswered. This lack of visibility slows OTA updates, spare part inventory management, and BoM adjustments, reducing customer satisfaction and shrinking margins.

Solution

SPREAD's Product Explorer for Aftermarket provides a digital aftersales twin, delivering full visibility into vehicles, fleets, and components. It can track OTA needs, spare part versions, and lifecycle updates using real-time workshop and fleet data. By refining BoMs and leveraging high-performing components for strategic pricing, it helps streamline spare part management, boost customer satisfaction, and drive profitability.

More than **25%** update BoMs efficiency for aftermarket needs

Up to **20%** lower warranty costs

visibility of fleet data, and component usage

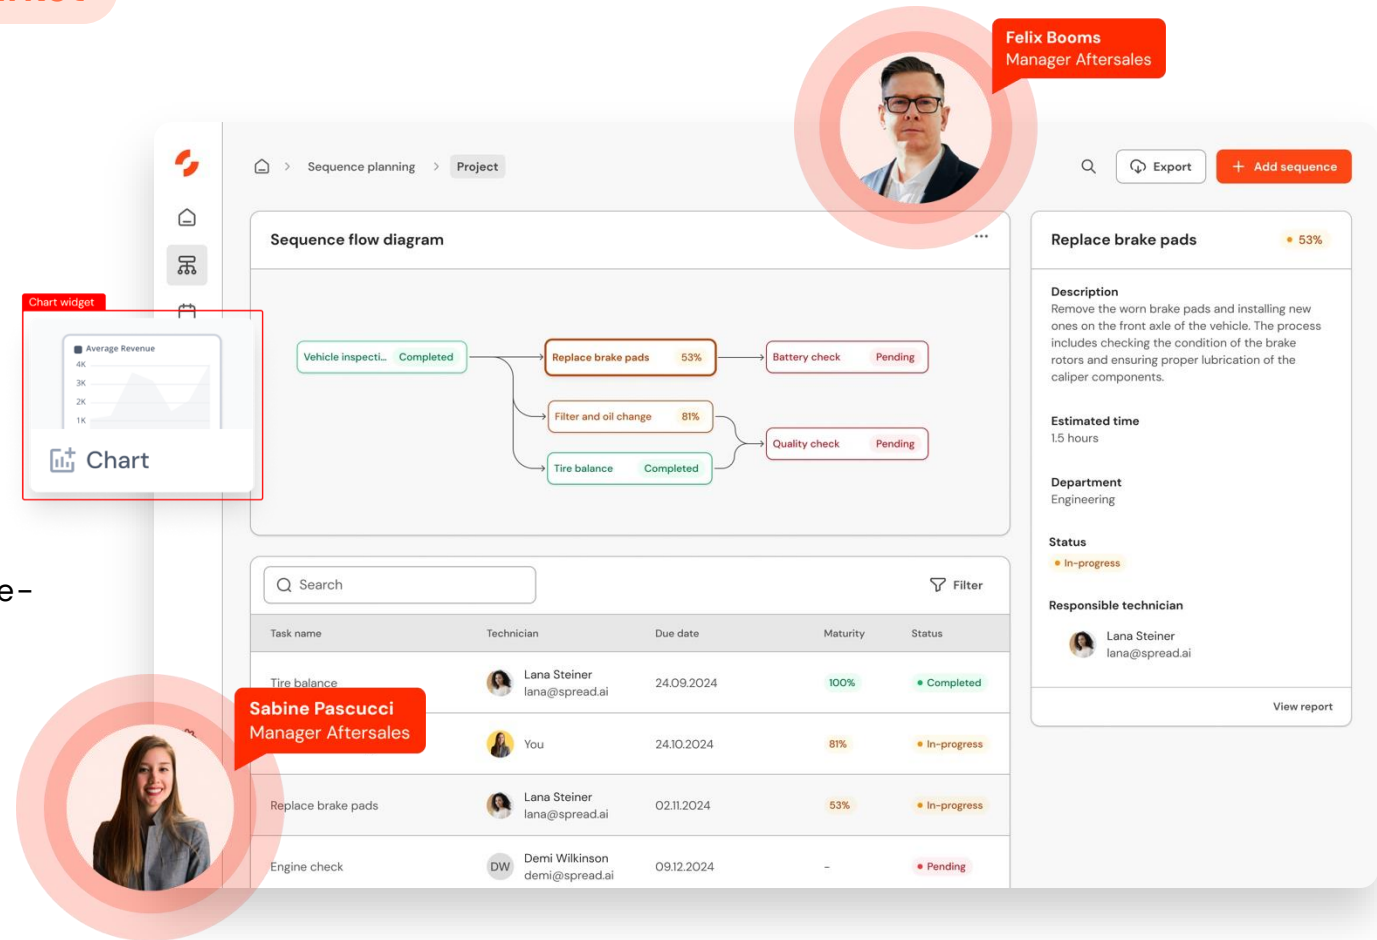

Optimize services with efficient repair instructions

Problem

In Aftermarket, planning repair and maintenance sequences can be time-consuming and error-prone. Service technicians need a structured approach to manage tasks efficiently and ensure that all steps are followed in the correct order to avoid rework and delays. Static and unspecific repair guides can lead to lost synergies.

Solution

Your Aftermarket team can generate and optimize repair and maintenance sequences with our algorithm-based sequence planning tool. By analyzing task dependencies for the issues at hand and providing actionable instructions, the tool streamlines your workflow and ensures that service operations are performed efficiently and accurately.

Up to
100%
reduction of
search time

Up to

Maximize efficiency in parts management for better service

Problem

Managing parts inventory and ensuring the availability of compatible components for repairs and maintenance is a major challenge. Inefficient parts management can result in delays, increased operational costs, and customer dissatisfaction.

Solution

Ensure that your Aftermarket team has access to seamless tracking, availability, and compatibility of components. By providing a centralized, real-time inventory system and automated compatibility checks, we help service teams quickly identify and source the right parts, enhancing operational efficiency and customer satisfaction.

Up to
50%

increased spare part
sales

⚠️ E/E Inspector in

🔧 Aftermarket

Resolve recurring E/E issues with system insights

Problem

In Aftersales, diagnosing and fixing faulty E/E or SW components can be time-consuming and costly, affecting warranty claims and customer satisfaction. Service technicians and workshops often struggle with inefficient troubleshooting tools, leading to delays and higher costs.

Solution

Your service technicians can leverage our advanced troubleshooting to quickly access accurate 3D models of vehicles, view installed components, and receive targeted error suggestions based on DTCs and architectural logic. By integrating 2D circuit diagrams for detailed exploration, technicians can rapidly locate and repair faulty components, improving service efficiency and reducing costs.

Up to
10x

faster troubleshooting

Up to
10%

lower warranty costs

Up to
25%

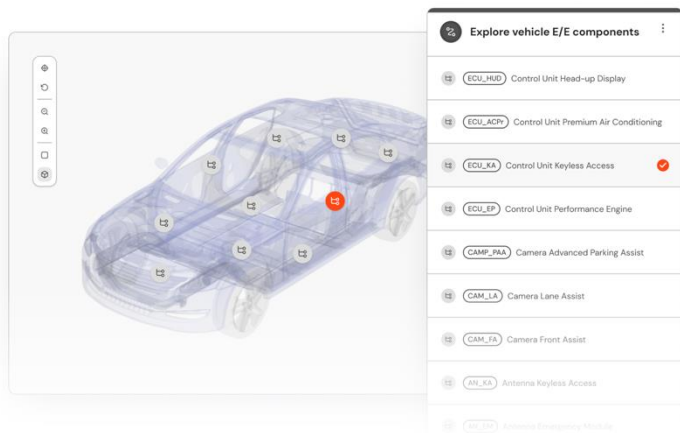

increase in First-Time Right (FTR) Rate

⚠️ E/E Inspector in

🔧 Aftermarket

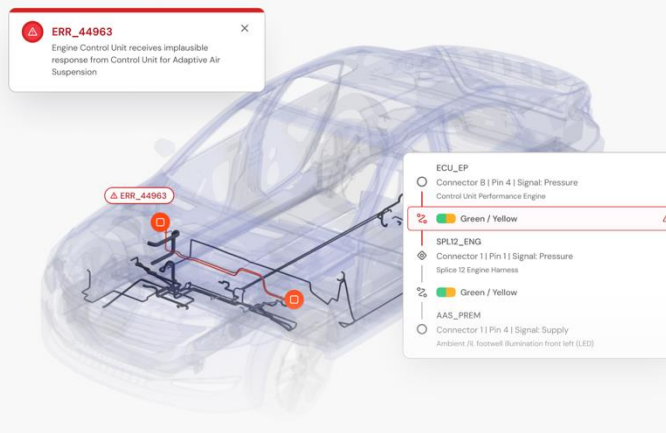

See the matching 3D model

Access the correct CAD model of the vehicle in question in a web-based 3D view allowing service employee to quickly view the installed components.

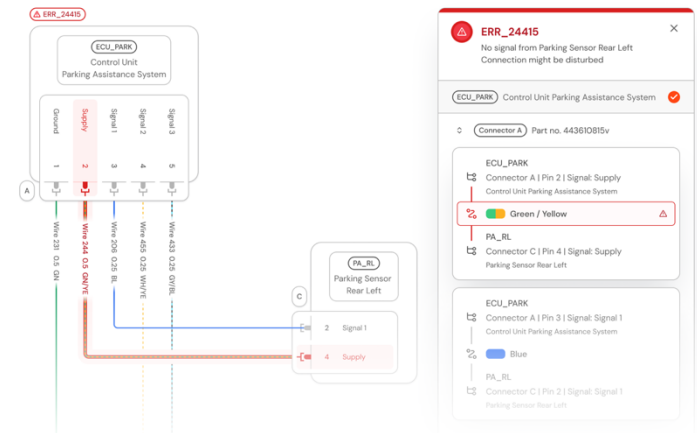

Get E/E & SW error suggestions

From the DTCs or other error codes, our data model identifies possible causes of errors based on architecture logic and product data and highlights them in the 3D model. This helps the service team find the correct troubleshooting solution more quickly.

Find and fix faulty components

The affected components can be further examined using the 2D circuit diagram, allowing for the quick identification and repair of faulty control units, fuses, grounds, switches, or other electrical components.

⚠️ E/E Inspector in

🔧 Aftermarket

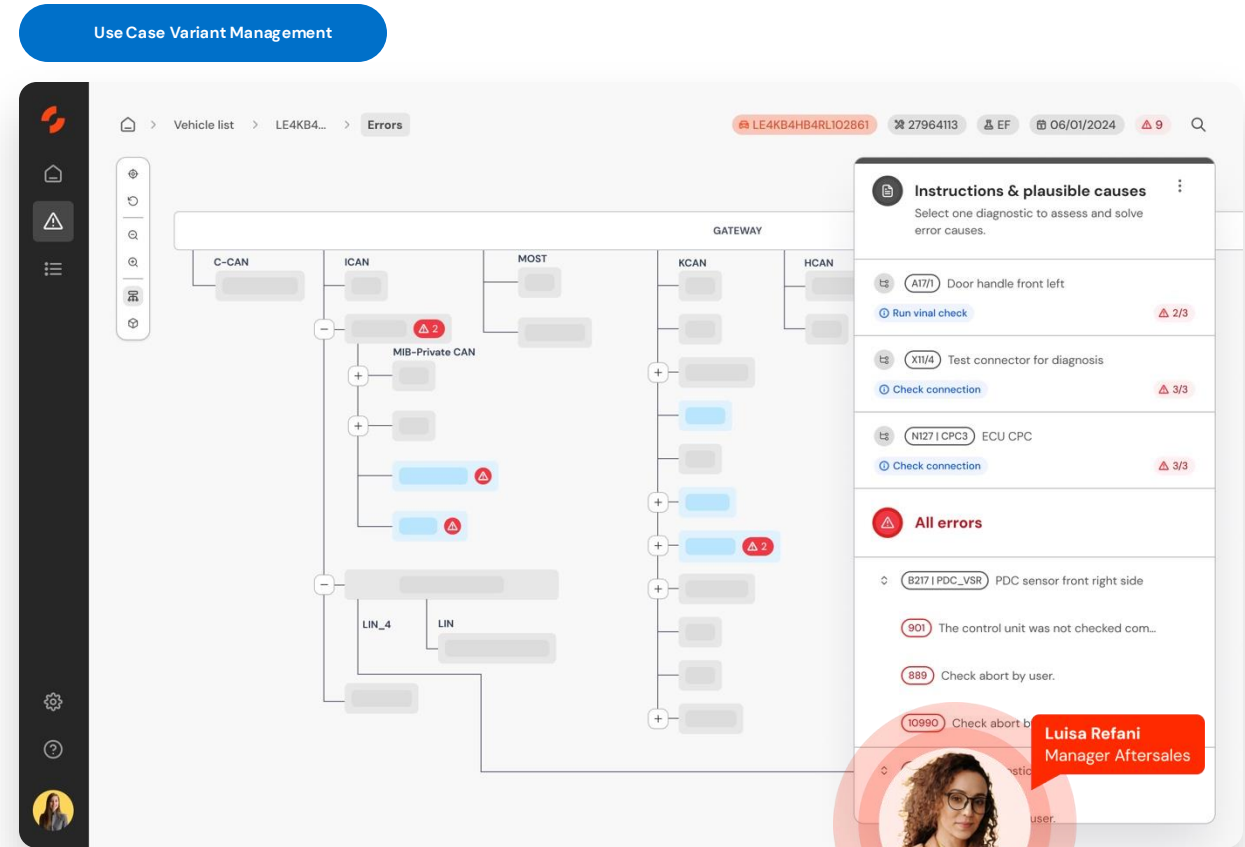

Boost resolutions with variant specific wiring viewer

Problem

Managing and servicing different vehicle variants in Aftermarket can be challenging due to the complexity of wiring and topology differences. Service technicians often struggle to identify the correct wiring and component layout for each specific variant, leading to increased repair times and errors.

Solution

Your Aftermarket team benefits from a tailored views of wiring and component layouts for each vehicle variant thanks to our variant-specific Wiring and Topology Viewer. By offering precise diagrams and topologies based on the specific variant being serviced, technicians can quickly and accurately locate and address issues, reducing repair times and minimizing errors.

Up to **9x** faster troubleshooting

Up to **20%** lower warranty costs

Lower staff skills level required

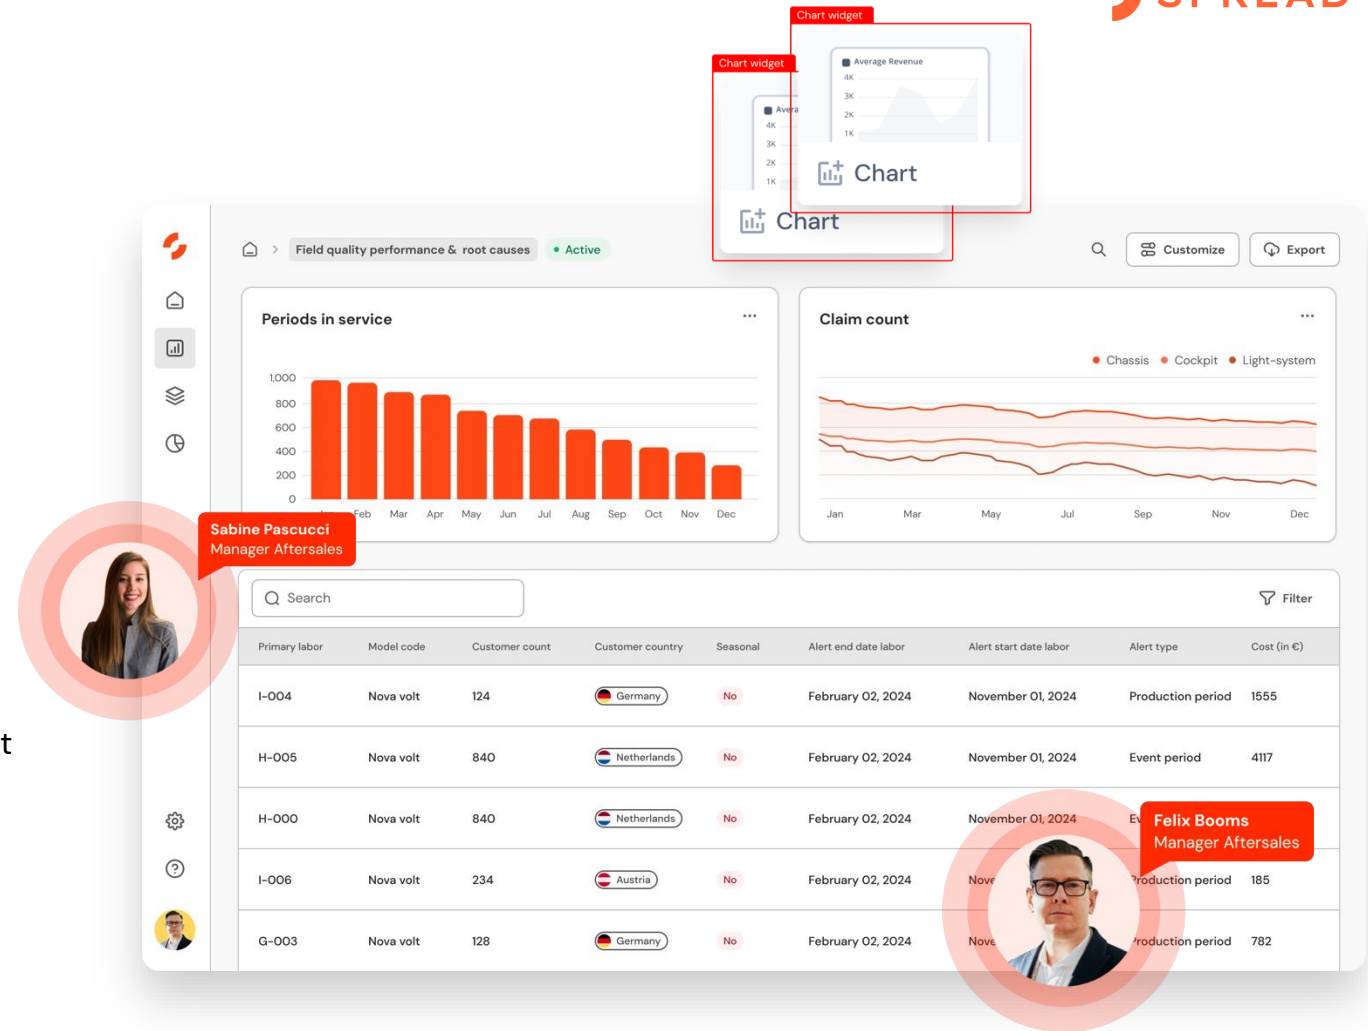

Connect field data to boost aftermarket services

Problem

Aftermarket managers and IT teams face recurring challenges in identifying and resolving field quality issues across vehicle variants. Disconnected systems between R&D, dealerships, and aftersales make it difficult to pinpoint root causes or determine affected vehicles. This reliance on manual analysis delays issue resolution, increases warranty costs, and raises recall risks.

Solution

Provide your team fleet-wide visibility into field quality issues by connecting product, variant, and operational data. Action Tower integrates inputs from R&D, dealerships, and aftersales into a scalable digital twin, automating root cause analysis and identifying recurring issues early. By offering actionable insights across the fleet, SPREAD helps reduce warranty costs, prevent recalls, and ensure proactive issue resolution.

Up to **70%**
faster issue resolution

Up to **10%**
lower warranty costs

Up to **20%**
increase in CSAT

(📡) Action Tower in 🔗 Aftermarket

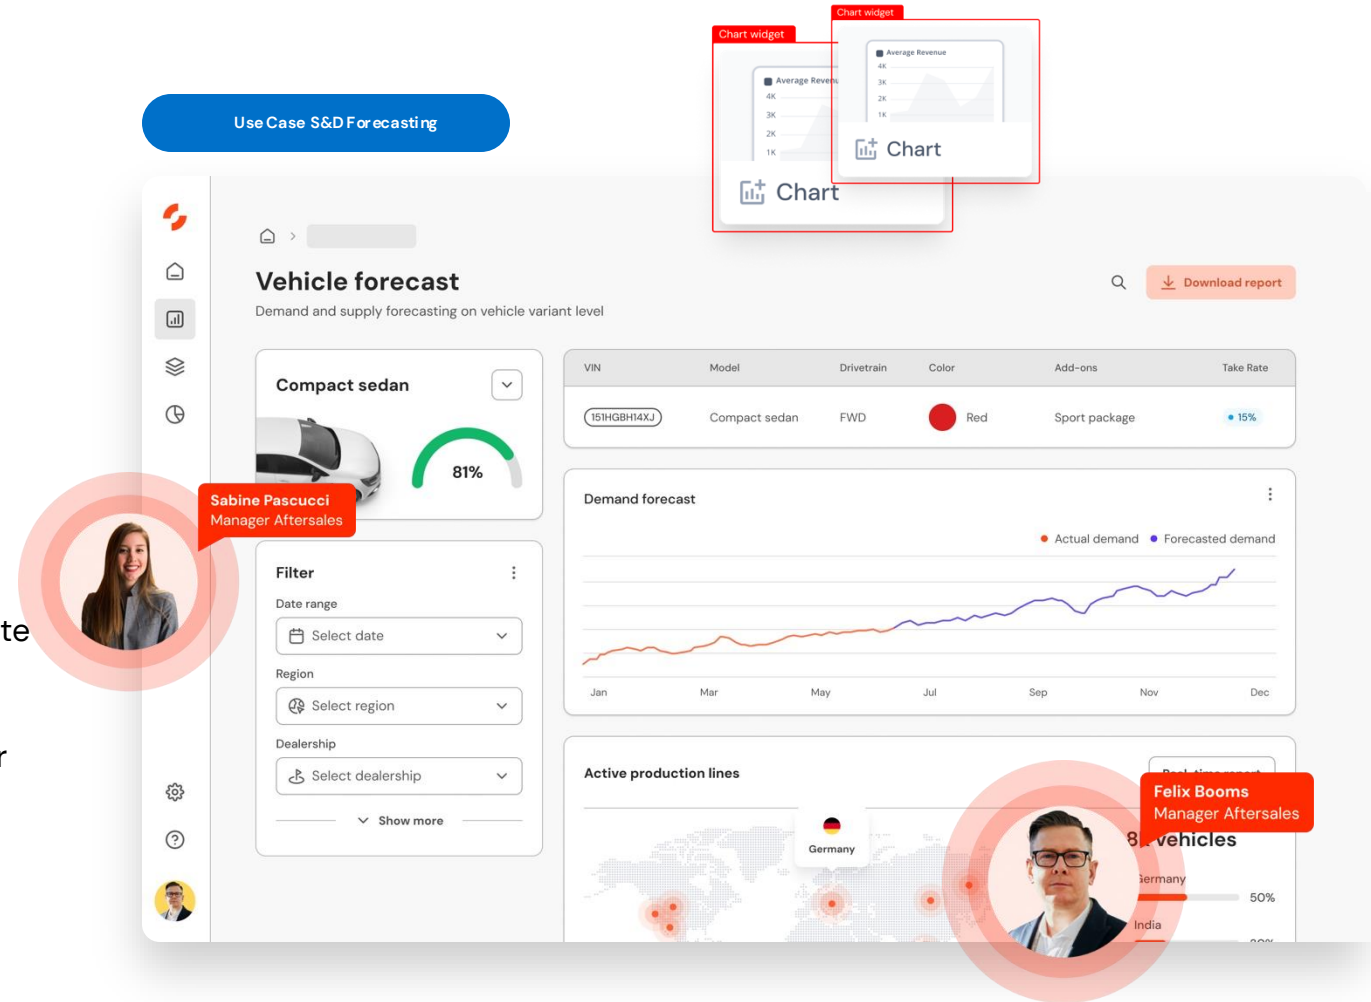

Optimize supply and demand alignment forecasting

Problem

Automotive manufacturers and dealerships often struggle with inaccurate demand forecasting at the vehicle variant level. This lack of precision leads to overproduction, underutilized production lines, and inventory shortages. Regional variations in preferences, such as drivetrain, color, or add-ons, further complicate the planning process, reducing profitability and customer satisfaction due to delayed deliveries or excessive stock.

Solution

SPREAD provides real-time demand and supply forecasting at the vehicle variant level. By analyzing take rates, production line activity, and regional preferences, it enables manufacturers and dealerships to align production with market demand. The system empowers users to adjust production plans dynamically, reduce excess inventory, and optimize resource allocation, ensuring timely delivery and improved profitability.

Up to **15%** increase in accuracy for demand predictions

Up to **20%** decrease overstock or shortages

(📡) Action Tower in 🔧 Aftermarket

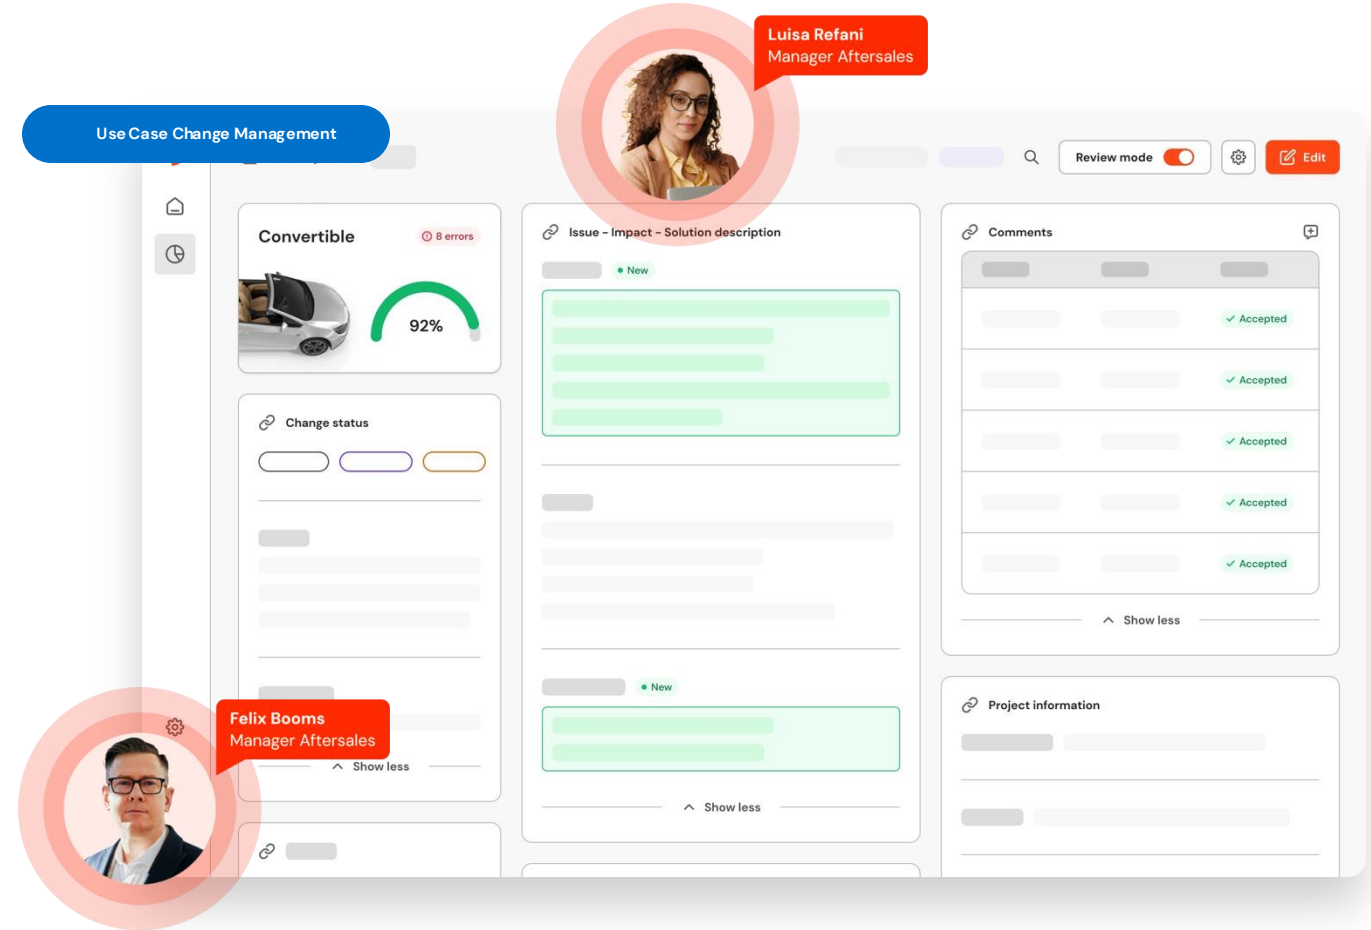

Trace changes and dependencies faster

Problem

In Aftermarket, tracing the implications of changes across all dependencies is crucial for maintaining service quality. Without effective change management, understanding the full impact of modifications can be challenging, resulting in increased errors and delays.

Solution

Provide your Aftermarket team with end-to-end traceability of changes and with a comprehensive view of how modifications impact all dependencies. By integrating information from various sources, changes are displayed and prioritized effectively.

Up to
60%
faster issue resolution

Improved
features
with feedback loop

Upskilling Coach in Aftermarket

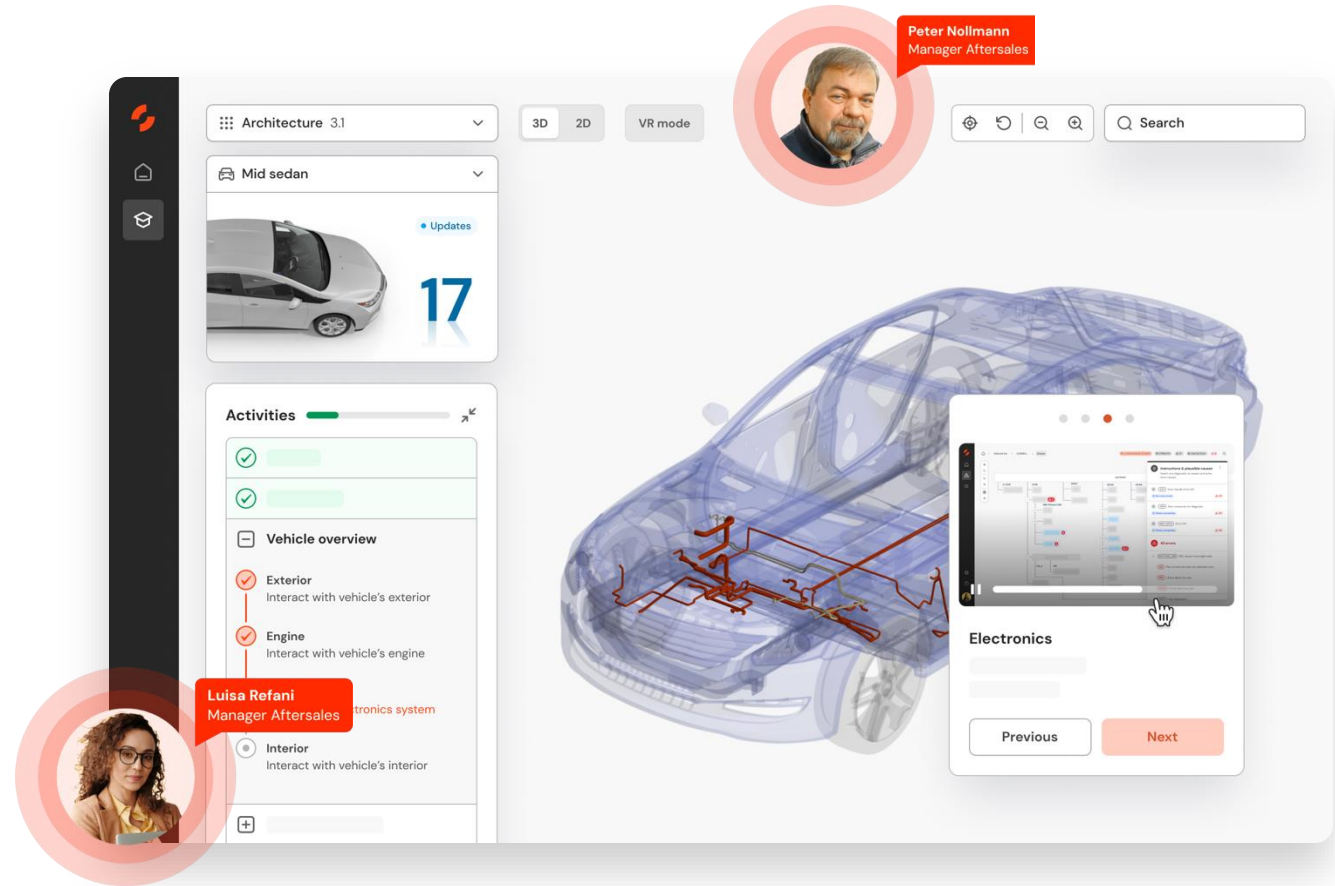

Deliver live repair insights and guidance

Problem

Aftermarket technicians and technical employees often struggle with inconsistent training during onboarding and limited access to up-to-date repair instructions, variant deltas, and learning resources while on the job. These gaps lead to inefficiencies in resolving customer issues, longer onboarding times, and knowledge deficits that negatively impact service quality and customer satisfaction.

Solution

Provide your technical Aftermarket team with a centralized knowledge repository that integrates repair instructions, variant deltas, and learning paths. This solution ensures technicians can access troubleshooting guides, product manuals, and training resources directly within their workflow. By supporting seamless onboarding and continuous upskilling, teams stay informed and equipped to solve customer problems efficiently, reducing onboarding time.

Up to **30%**

onboarding time reduction

Up to **10%**

increase of First-Time Fix rate

Up to **20%**

reduced access time

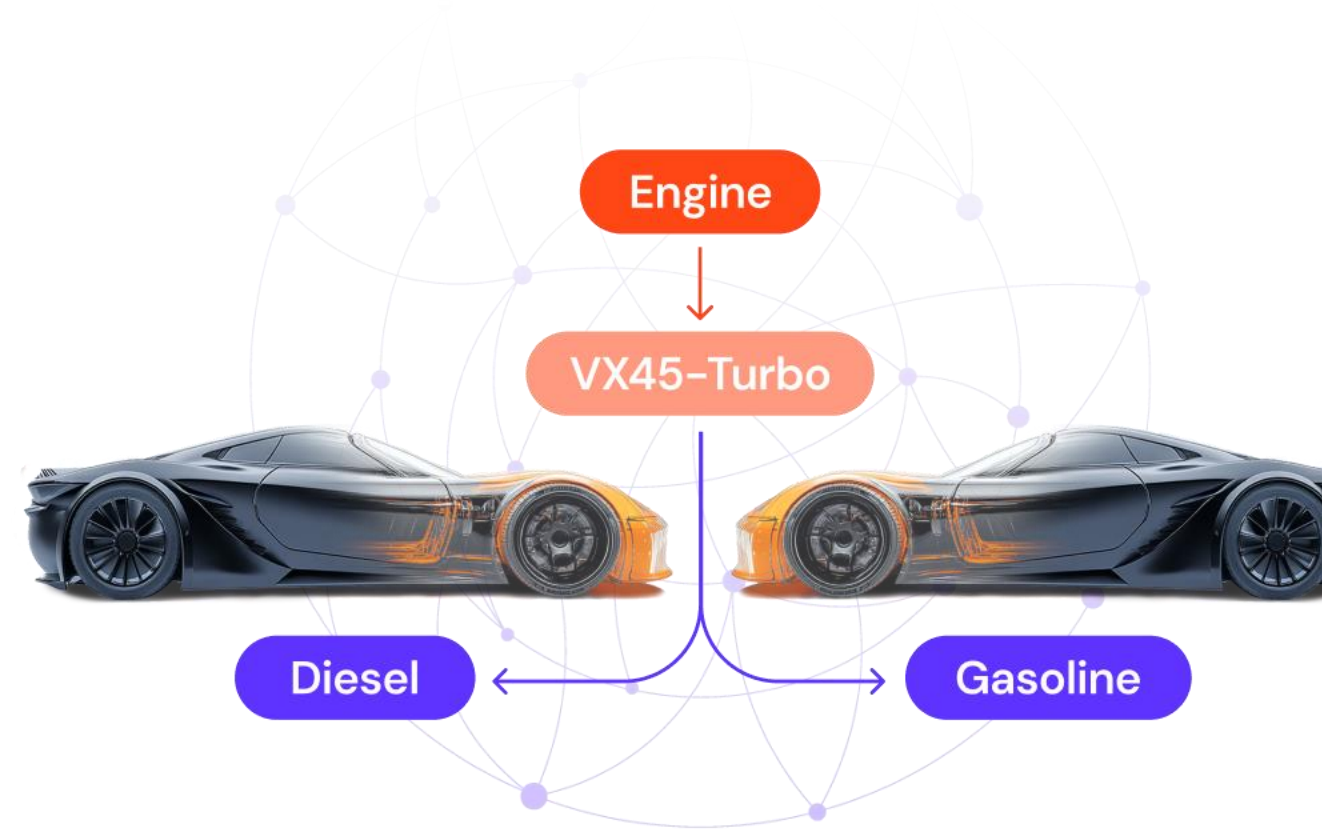

Navigate product architectures to decode complexity

Problem

In product development, teams struggle with understanding and navigating requirements, configurations, and dependencies across multiple product variants. This lack of transparency leads to inefficiencies, misalignment, and delays, particularly in the aftermarket, where insights into E/E and software components are often missing.

Solution

Product Explorer provides a unified view of product architectures, enabling teams to navigate requirements, configurations, and dependencies effortlessly across variants. In the aftermarket phase, it enhances visibility into E/E and software components, empowering teams to make informed decisions, reduce complexity, and optimize product management across the entire lifecycle.

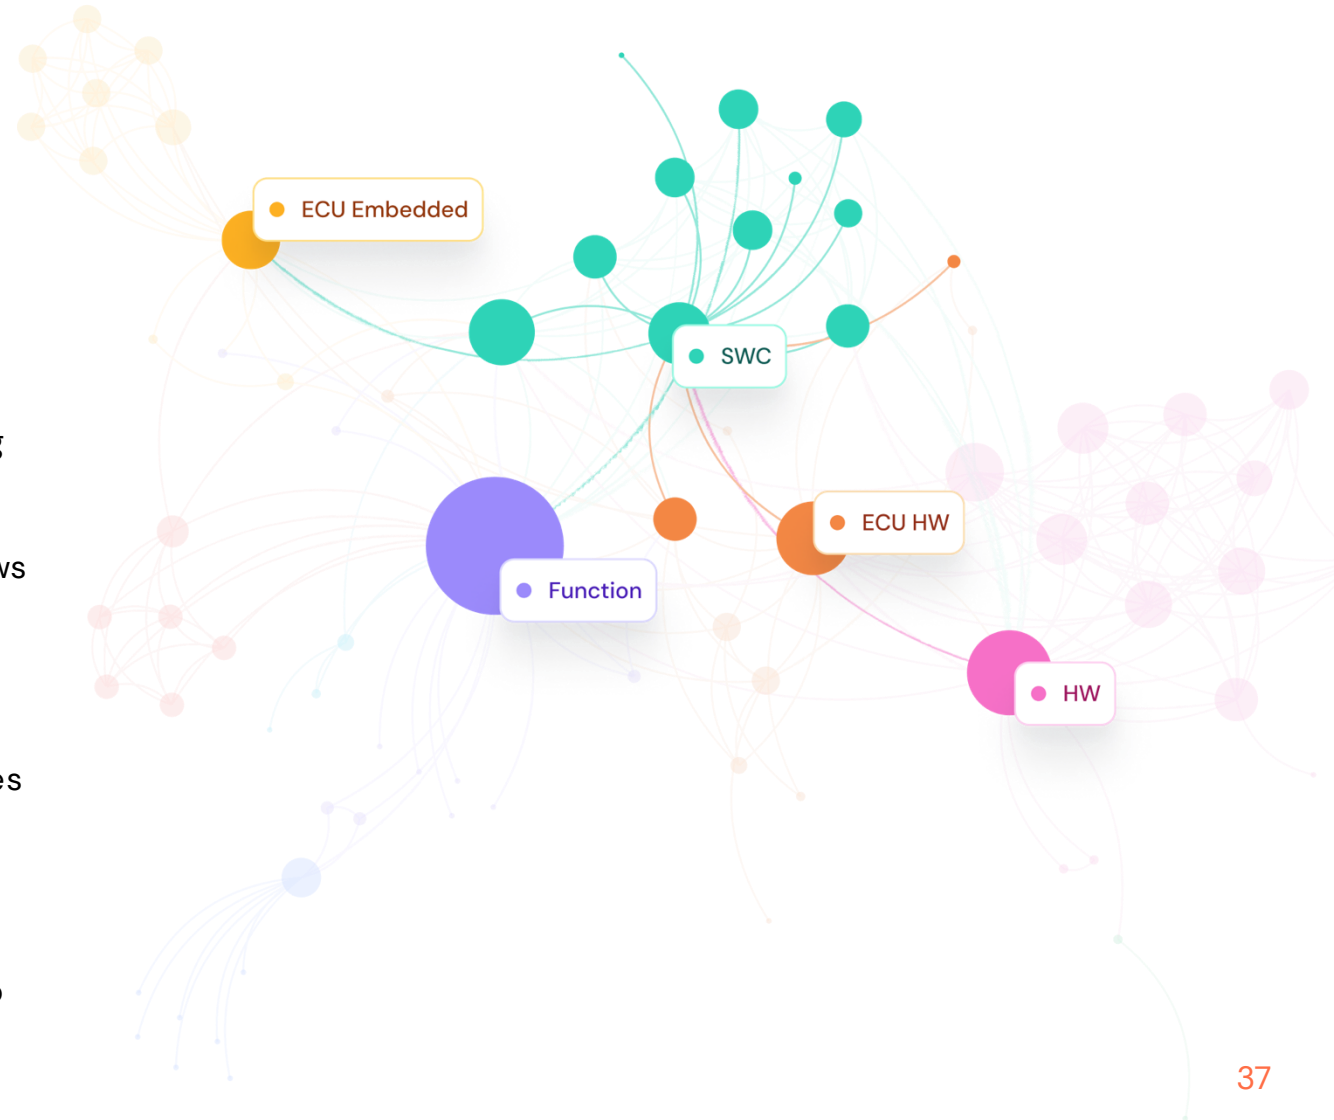

Design system architectures that drive lifecycle efficiency

Problem

Effectively managing product architectures across the lifecycle is challenging due to the complexity of aligning requirements, dependencies, and configurations. Without clear visibility into these elements, delays occur in development, inefficiencies arise in production, and managing repair workflows or spare parts in the aftermarket becomes time-consuming and costly. This hinders innovation, increases effort, and impacts overall lifecycle efficiency.

Solution

Product Architect enables teams to design and optimize system architectures by defining and refining requirements, linking functions to components, and managing dependencies across all variants. It facilitates alignment between R&D and production by ensuring product designs meet production needs, minimizing inefficiencies and disruptions. In aftermarket, it automates the creation of repair workflows, manuals, and spare part coordination, tailored to variant-specific requirements.

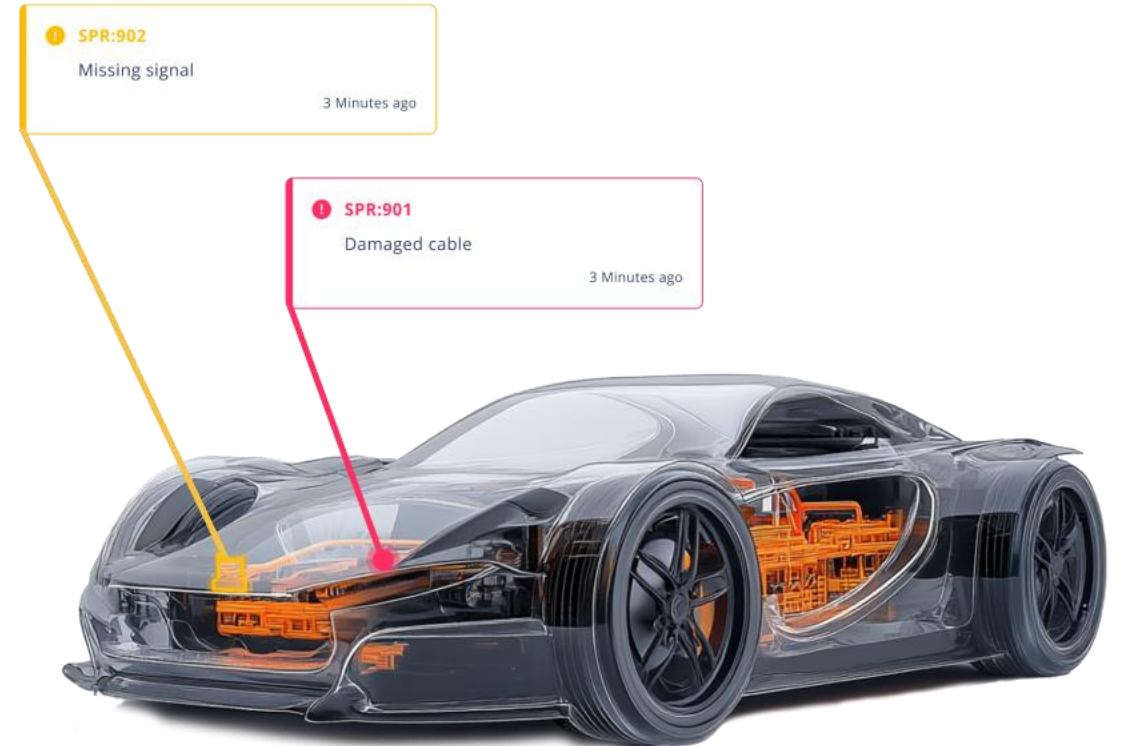

Find and solve E/E software issues earlier across your lifecycle

Problem

As mechatronic systems grow more complex, identifying and diagnosing electrical and software issues becomes increasingly difficult. Without clear insights into system dependencies, errors can cascade through R&D, production, and aftermarket phases, causing delays, inefficiencies, and escalating costs.

Solution

Enable your engineers and service technicians to detect and resolve E/E and software issues earlier with a holistic diagnostic solution. By uncovering root causes, linking errors to dependencies, and reducing troubleshooting time, it supports faster resolutions, higher first-pass yields and smoother operations across your entire product lifecycle.

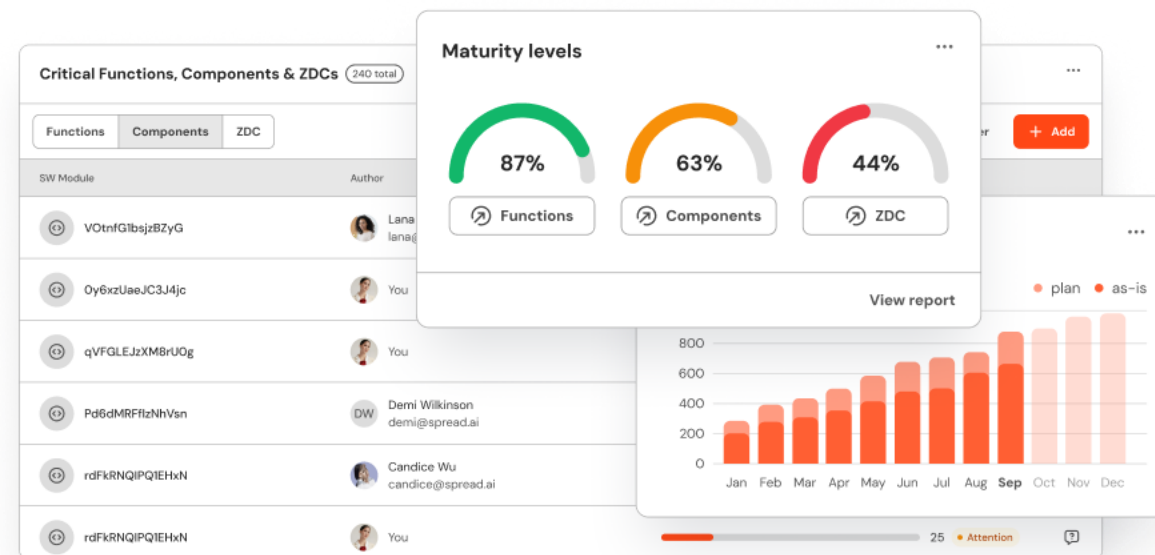

Gain complete visibility and control over product data and performance

Problem

Disconnected data and processes across R&D, production, and aftermarket make it difficult to track product maturity, manage changes, and ensure consistent performance. This fragmentation leads to delays, quality issues, and missed opportunities to optimize product performance at every stage.

Solution

Action Tower unifies R&D, production, and field data, providing complete visibility into product maturity, release orchestration, and change management. It syncs production line data with product configurations to optimize throughput, quality, and error resolution. In aftermarket, it connects field data to identify root causes, track variant-specific issues, and enhance product diagnostics. By creating a centralized view, Action Tower empowers teams to improve efficiency, ensure quality, and accelerate decision-making throughout the product lifecycle.

Accelerate upskilling to boost team efficiency and lifecycle performance

Problem

With increasing product complexity and rapidly evolving processes, production and aftermarket teams often lack the knowledge needed to perform efficiently. This knowledge gap slows problem-solving, reduces operational efficiency, and limits the ability to adapt to new challenges, ultimately impacting overall performance.

Solution

Upskilling Coach accelerates expertise by delivering instant, role-specific access to tailored product knowledge, interactive learning paths, and actionable insights. It empowers teams to quickly adapt to new requirements, resolve issues faster, and confidently handle complex tasks in production and aftermarket. By bridging the skills gap, Upskilling Coach boosts productivity, accelerate ramp-up phases, and ensures consistent, high-quality operations.
