

Core Landing Zone: 5-Wk Implementation

- **Problem**

- Our client was managing their Azure environment by hand deploying and configuring each of their resources with individually.
- They lacked a solid strategy around governance and security and did not understand the Cloud Adoption Framework to ensure their cloud applications were following cloud principles.
- Security issues also came into play often as best practices were often overlooked.

- **Solution**

- We defined the client's Cloud Adoption Strategy so that they had a plan for how applications would be migrated, modernized and innovation could be allowed in the cloud.
- We have been steadily implementing this strategy in stages to minimize impact of process and technology changes along the way.
- The initial landing zone that was in place was scaled up to meet the growing needs to provide greater security, operational excellence and be more cost effective as they grew.

- **Benefits**

- Our client has seen a quicker time to market when deploying workloads to their environment.
- When deploying new workloads and managing existing workloads, less issues have come up around configuration due to the standard nature of configuration management.
