# Azure InfraOps QuickStart

- **Problem**
    - Our client was managing their Azure environment by hand deploying and configuring each of their resources with individually.
    - This led to issues with consistency of configuration in their resources which caused application issues that took time and effort to troubleshoot.
    - Security issues also came into play often as best practices were often overlooked.

- **Solution**
    - We defined the client's InfraOps strategy that would move to a deployment methodology that allowed standard configuration, streamlined deployment/change control and improved security and tighter control of the environment.
    - We have been steadily implementing this strategy in stages to minimize impact of process and technology changes along the way.

- **Benefits**
    - Our client has seen a quicker time to market when deploying workloads to their environment.
    - When deploying new workloads and managing existing workloads, less issues have come up around configuration due to the standard nature of configuration management.
