

# Spyglass 365 For Azure

## The Challenge

- Our client was managing their Azure environment by hand deploying and configuring each of their resources with individually.
- This led to issues with consistency of configuration in their resources which caused application issues that took time and effort to troubleshoot.
- Security issues also came into play often as best practices were often overlooked.

## The Solution

- We defined the client's cloud operational strategy that would move to a deployment methodology that allowed standard configuration, streamlined deployment/change control and improved security and tighter control of the environment.
- We have been steadily implementing this strategy in stages to minimize impact of process and technology changes along the way.

## The Benefits

- Our client has seen a quicker time to market when deploying workloads to their environment.
- New Azure and Microsoft capabilities and features have been able to be piloted and rolled out quicker and more efficiently due to operational speed that we can provide.
- Decreased operational issues with new and existing workloads.
