

# Power BI Embedded: Enabling End Users

Power BI Embedded integrates with disparate business systems and can eliminate context switching associated with having to access reports and presents them where and when it's the most timely. You've got the data. It's ingrained in every detail of your business. What you do with that data is what takes your business information and makes it business intelligence. Power BI Embedded provides contextually relevant insights into your business's daily life by integrating with existing business applications.

## Power BI Embedded

Power BI Embedded takes the **power** of Power BI to the next level. Rather than navigating to the Power BI Service, the Embedded option seamlessly integrates with your applications so that your customers or internal stakeholders can access and evaluate their data with interactive report visuals in real-time and can slice-and-dice the information as needed. Embedded provides efficiencies through an immersive approach with the benefit of attractive, volume-based licensing, saving time and financial resources.

## During the Engagement

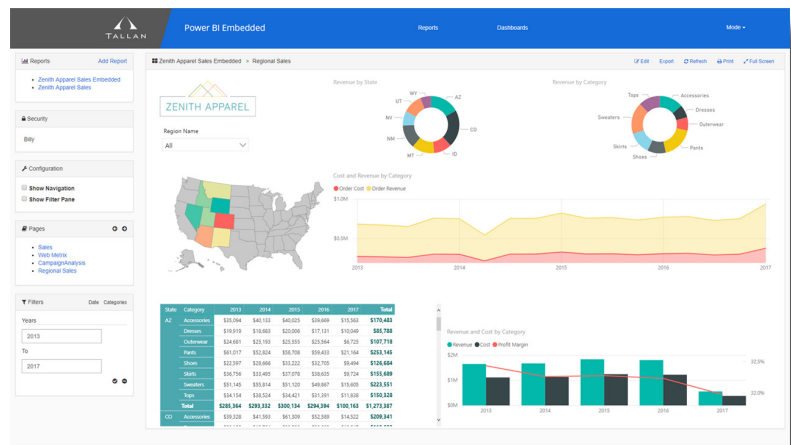

Tallan will work with your operational and technical teams to evaluate the current data environment and implement Power BI's Embedded features within an existing or new application.

### We will assess

- Existing data sources
- Security requirements
- Licensing position
- Current infrastructure
- Organizational skills and structure

### Deliverables

- Full code of sample ASP.NET MVC website
- All sample PBIX files that are modified as part of the POC
- High level architecture documentation describing sample site and functionality

## Experience Talent-Driven Innovation

Founded in 1985, Tallan provides technology and business process consulting services to enterprise and mid-sized companies, as well as government entities, with a focus on Custom Development, Portals and Collaboration, Business Intelligence, Application Integration, Mobile Platforms, User Experience, Ecommerce, Web Development, and Cloud Services.
