TCS Cloud Strategy Decision Services – 6 Weeks

TCS' Cloud Strategy Decision Services provides orientation on how TCS works with customers to deliver a Microsoft Azure-based cloud assessment.

We use a "three-pronged approach" which determine and evaluate the enterprise IT landscape and advise on cloud adoption strategy to Azure. There are various levers considered as a key element in the three-pronged approach which will help determining the correct target state.

We use the following during the Application Discovery in addition to customer's existing toolset as needed.

- Cloud Counsel offering helps define target cloud model, business case, migration analysis, comparative analysis, and recommendation on cloud provider
- CMDB (Configuration Management Database), Excel sheets, EA (Enterprise Architect) tools, APM (Application performance monitoring)
- Data collection templates

These help to plan application migration projects quickly and reliably by automatically identifying applications running in on-premises datacentres with its configuration, usage data (of workloads, network, storage), their associated dependencies, and their performance profile. All this information will be analysed and presented to build appropriate migration solution which ultimately help to reduce the migration complexity and planning time.

Deliverables

The detailed assessment of 50 apps with 250 server's outcomes will provide greater confidence to the customers on the cloud journey which usually takes 6 to 10 weeks.

Following are the deliverables provided to customers as a part of successful assessment completion.

- Target cloud model
- Business case
- Migration path
- Detailed migration roadmap
- And other helpful recommendations

Take advantage of our briefing session to explore the business and technical benefits of the solution and get a proven path to unlock its benefits for your cloud adoption journey.
