

Intelligent automation for the enterprise

Intelligent automation and process management are central to our product philosophy, delivering unparalleled levels of control, efficiency, and customer satisfaction by transforming the way our customers collect, understand and act on the content entering their organization

DocPro*

The most modern technology, delivered in a single platform, efficiently provides you the information your business runs on.

DocProStar provides a modern, unified architecture for building, deploying, monitoring and managing processes, accelerating the adoption of intelligent process automation across the enterprise.

No/low code process design and visualization inside a standard BPMN modeling canvas provide agility to respond quickly when reacting to new requirements, making changes to existing processes or adding new processes to the platform.

Compliance is built-in, and abundant monitoring capabilities guarantee excellent process visibility at all times.

Scale up & Scale out

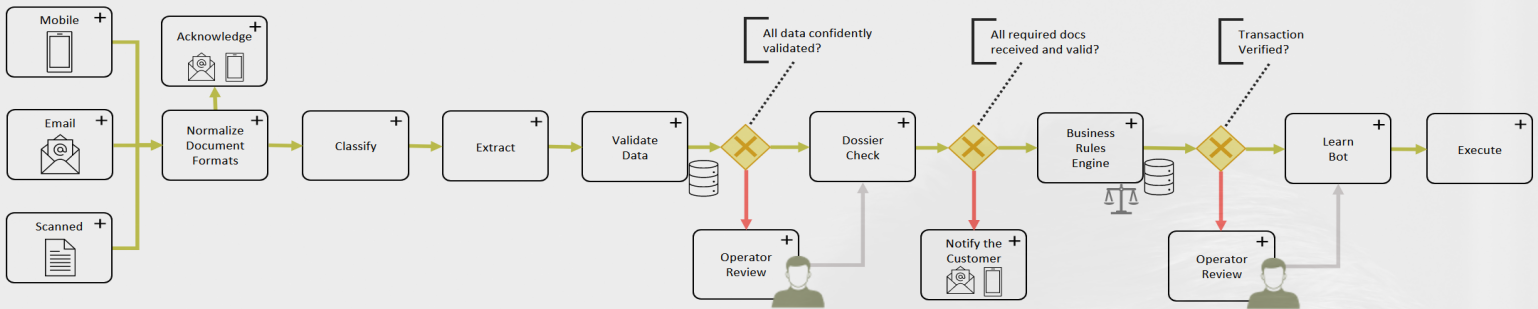

A high-performance, rule-based workflow platform for handling high-volume processing, combined with a unified interface for building and managing multiple processes, makes DocProStar perfect for intelligent automation across the enterprise.

Simple to integrate

DocProStar leverages an impressive stack of state-of-the-art technologies to achieve high-automation processing. Built on a service-oriented architecture, it's simple to integrate with existing IT solutions.

Speed up adoption

Processes are built with a simple graphical process representation utilizing drag&drop actions from Business Process Model and Notation (BPMN) standards. This cuts implementation times by facilitating collaboration between IT, subject specialists, and users.

COLLECT

DocProStar applies intelligence and automation to content collection. Instead of simply capturing content, DocProStar enables process improvement and enhances efficiency by taking appropriate decisions and actions at the earliest opportunity.

The outcome of intelligent collection is connected and standardized processes, with content transformed into a single digital norm regardless of source or format.

UNDERSTAND

DocProStar analyzes content to extract—and understand—its meaning in a business context: What process does it belong to? What information can we extract? Can we gather more insights from our customer communication?

Intelligent understanding transforms content into actionable business information. Using modern technologies, DocProStar's intelligent automation classifies, extracts, and validates the data previously locked inside your content, leaving only exceptions to be handled by an operator.

ACT

This unique ability to take action and dynamically control processes from start to end is what separates DocProStar from the competition.

DocProStar's smart, dynamic, and intelligent process automation combines business information from the Understand step with rules and data from integrated systems. It is then simple to automate and drive decisions, make approvals, and apply intelligent routing through the process.

Flexible Deployment

Equally capable of running in the cloud or on premise, DocProStar's modern architecture can meet your requirements. Support for dockers/containers (e.g. Azure Kubernetes) ensures maximum scalability.

Embrace Change, Remain Agile

DocProStar's library of >100 activities makes building processes simple and intuitive. Open APIs make it easy to add activities to the library to integrate existing systems or incorporate complementary third-party solutions.

”

TCG Process has developed a leading set of modular cloud-oriented Capture 2.0 services to leverage process input, thus enabling the use of capture within the business process rather than just as the first step in a process. This results in substantially increased value for its customers.
