**TEAM CENTRAL**

Microsoft Solutions partner

Streamline Rent Manager Data Management with No-Code Automation!

ABOUT TEAMCENTRAL

We have a no-code intelligent automation platform called "Central" that manages data governance and increases productivity through leading edge technology. We are one of the only data quality and testability focused solutions in the market, and make life easy and cost effective for companies with limited technical skills and integration / automation budget constraints. Quick to implement, easy to scale, and no code to maintain!

WHAT WE OFFER

"Central" was built to put efficient data management across systems into the hands of companies that don't have the technical expertise to custom develop integrations and automation. Whether you want to leverage our pre-built connectors, or easily build new ones on our low/no-code platform, your systems will be talking soon!

The key to intelligent automation on Central is a focus on data quality management, not just pushing ungoverned data in and out of systems. Our event stream architecture allows you to make testable publish/subscribe data filtering and business rule changes quickly without code. Unlike other commercially available connectors, we are not limited by "out of the box" purpose-built use cases, but instead invite you to tailor the data synch experience to your needs. In hours and days, not weeks or months.

See what customers are saying:

"Working with TeamCentral has made it much easier on our IT group to connect systems and data. Their low code automation solution is an essential part of how our business runs today."

– Large North American Transportation Company

Central is built on Azure services including Azure Service Bus, Cosmos DB, Azure API Management and Vault to ensure that reliability, scalability and security are all achieved in a highly performant and low maintenance solution.

Cost Effective | Scalable | Easy to Implement & Maintain

EXAMPLE DATA CONNECTORS:

Dynamics 365   Acumatica   BIGCOMMERCE   shopify   salesforce   Power BI   ADP
