Q&A

FAQ

Budget Constraints

Current cybersecurity solutions are expensive, and most MSPs use only about 10 percent of the features offered.

Product Bloat

Organizations today use too many single-point cybersecurity tools, many of which don't interoperate, reducing effectiveness and increasing complexity.

Complex Compliance Requirements

Many companies fail to meet the minimum cybersecurity compliance requirements because regulatory policies can be complex and overwhelming to track and follow

Solution:

By combining multiple cyber risk management functions and capabilities in a SINGLE, affordably priced platform, **TRACE increases user efficiency by 5x and significantly reduces the operational cost of a complete vulnerability management solution**.

Solution:

By combining all essential cyber risk discovery, assessment, and mitigation capabilities in a single SaaS platform, **TRACE removes the need for multiple vulnerability and risk management tools, allowing a shift towards a simple, more streamlined single-vendor approach**.

Solution:

TRACE automatically determines when organizations are not in compliance with the regulatory requirements relevant to them. **Organizations can track compliance** with PCI DSS, HIPAA, NIST CSF, CIS Controls, see mitigation suggestions, fill security gaps, and generate a complete cyber risk assessment report.

FAQ

Resource Constraints

The multiple single-point products that organizations use today require trained cybersecurity professionals to operate them. Moreover, all these products need to work seamlessly together to be effective, requiring additional engineering expertise. Trained cybersecurity professionals are difficult to find and expensive to hire.

Solution:

TRACE is quick and easy to deploy and stunningly simple to use. It **requires no additional hiring or investment in resources. It also combines multiple scanning and mitigation capabilities in one interface**, meaning that there is no need to work on putting together different solutions by different vendors.
