

Test automation is an essential pillar in the solutions development process that drives efficiency and quality of the final product.

At Teia, we understand that not all tests can be automated. We recognize that manual testing remains essential to address such vital aspects as usability and the user experience that the business seeks.

With Test Genius we take you to the next level:

1. Clear Objectives and Relevance:

We help you establish clear objectives to define test automation requirements. Test Genius integrates effectively into your development process, ensuring that tests are relevant and achieve the goal in your projects.

2. Efficient Test Data Management:

With Test Genius, we simplify the management of your test data, allowing you to run test cases with different data sets. Efficiency is the key, and our offering ensures that your data is always under control without dependencies on cloud environments, as we can operate in an on-premises environment.

3. Promotion of Collaboration:

We promote collaboration between your development and testing teams. Test results are shared and discussed in a collaborative environment to effectively address quality issues and achieve the project objective.

4. Realistic Testing Environments:

We set up testing environments that are virtually similar to pre-production environments. From database configurations to servers, we ensure your tests reflect as closely as possible your real environment, allowing you to detect problems before they reach your end users.

Let us be the business partner that accompanies you in the search for efficiency, quality, results and speed in the development of solutions. Improve your development processes and guarantee the satisfaction of your users with our cutting-edge testing offer, through the results of your business objectives in your projects.
